### Search Notes

Dear Examiner Pond:

Please find attached the results of your search for 09/988672.

The search was conducted using the mandatory database lists for Business Methods.

These other sources were also used: Internet

If you have any questions, please do not hesitate to contact me.

Thanks for using EIC3600!

Ginger

# STIC EIC 3600 Search Request Form

185705

Today's Date: 4/18/06 Class/Subclass 205/26-27

What date would you like to use to limit the search?  
Priority Date: 2/10/01 Other:

Name Rob Paul

AU 3625 Examiner # 78748

Room # 5D01 Phone 2-6762

Serial # 09/988,672

Format for Search Results (Circle One):

PAPER  DISK  EMAIL

Where have you searched so far?

USP  DWPI  EPO  JPO  ACM  IBM TDB

IEEE  INSPEC  SPI Other Request/Print

Is this a "Fast & Focused" Search Request? (Circle One)  YES  NO

A "Fast & Focused" Search is completed in 2-3 hours (maximum). The search must be on a very specific topic and meet certain criteria. The criteria are posted in EIC3600 and on the EIC3600 NPL Web Page at <http://ptoweb/patents/stic/stic-ic3600.htm>.

What is the topic, novelty, motivation, utility, or other specific details defining the desired focus of this search? Please include the concepts, synonyms, keywords, acronyms, definitions, strategies, and anything else that helps to describe the topic. Please attach a copy of the abstract, background, brief summary, pertinent claims and any citations of relevant art you have found.

① User/consumer calls shopping service and creates a password.

② Shopping service stores password.

③ User hangs up

④ Shopping service calls user back & requests the password

Callback/dialback system that allows the user to create the password. See Figs. 2 & 3A

## Voluntary Results Feedback Form

➤ *I am an examiner in Workgroup:*  *Example: 3620 (optional)*

➤ *Relevant prior art found, search results used as follows:*

- 102 rejection
- 103 rejection
- Cited as being of interest.
- Helped examiner better understand the invention.
- Helped examiner better understand the state of the art in their technology.

*Types of relevant prior art found:*

- Foreign Patent(s)
- Non-Patent Literature  
(journal articles, conference proceedings, new product announcements etc.)

➤ *Relevant prior art not found:*

- Results verified the lack of relevant prior art (helped determine patentability).
- Results were not useful in determining patentability or understanding the invention.

**New technology spans the world**  
McGrath, Neal  
Asian Business v31n10 PP: 62-65 Oct 1995  
ISSN: 0254-3729 JRNL CODE: ABN  
WORD COUNT: 2067

...TEXT: the telecoms industry.

The fact is that if someone in China wants to use a callback service, there's nothing the MPT can do to stop it.

The service works like this: Once you have set up an account with the callback company, all you do is dial a number in the US, let the phone ring once and hang up. The company's computer calls you back. You answer and are automatically plugged into the US network.

Consumers love callback services because they are 40% to 50% cheaper than local telephone companies. Monopolies hate them...

...Unfortunately, the regulators are powerless to stop these scrappy new competitors. Blocking calls to the callback number is not feasible because each customer has a different access telephone number. Regulators could try blocking out the entire area code where the callback company operates, but the company could just move its switching equipment to...

...TEXT: are doing inside, and no one guarding the exit.

Another form of security is the dialback system. The caller enters his ID and password, the system looks up the user's phone number, hangs up and then calls back. But this can also be defeated by programs that keep the line open, mimic a dial tone and then 'answer' after the system has finished dialing. The computer thinks it has hung up and called back the person at home, but...

...the user inserts a card or other token into his computer and then enters a password. Without the card, hackers can't get into the system.

Of course, making sure that...

...TEXT: Republic, popular locations for hackers to call.

THE END AROUND

The firm is also using dialback modems to guard against hackers using a modem and ASCII terminal to break into remote maintenance ports used to configure and program PBXs and voice mail systems. Dialback modems make access to maintenance ports more difficult.

These modems require incoming callers to enter a password. Once the password is entered, the modem automatically terminates the call. The dialback modem then consults its memory to verify the password, finds the phone number associated with that password and calls back the remote modem. This provides an extra layer of security and allows access only to...

...ABSTRACT: it is only available when connecting to another Telebit modem. Useful features include built-in callback security, which lets an originating user dial a predefined number and enter a password ; the answering modem then hangs up the phone and calls back after 10 seconds, checking the originating modem's number against its list of authorized users...

... PEP is available only when you are connecting to another Telebit modem.

The T2500's callback security feature allows an originating user to dial a predefined number. The answering modem prompts for a password . If the originating modem sends a valid password , the answering modem hangs up the phone , waits 10 seconds, then calls back . Because the called modem has the originating modem's number indexed against its password , the called modem can easily look up the number. Password security is also available to control connections between selected modems.

SELECTION BY SWITCH

The off...

... of security most frequently offered by host-external security equipment include passthrough log-on, fixed callback , variable callback and a method of connection qualifiers to authorized users, called password connection security (PCS).

Passthrough log-on is similar to host log-on, but with more features.

Fixed callback is among the most effective dial-access security tools available today. This method associates a telephone number in the database with the password and Id pair. After entering both password and ID, the system hangs up the phone and calls the user back before linking him to the host.

Fixed callback provides virtually unbreakable security for the host. The user must memorize the same password and ID needed for log-on and must call from the same location.

A number...

...of what passwords and IDs they know.

Second, should a hacker get hold of the password and ID, the hacker still would not be able to access the host because the...

... of the fact (agreed to by most international service providers) that regardless of where a call originates and terminates, if it isn't answered, the caller doesn't pay for it. Conventional international callback services use such unanswered phone calls as signals (the practice is known as "code calling"), telling them to CALL BACK whoever called, and offer U.S. dialtone by bridging in a second trunk.

Yes, the caller pays for the callback call (from the provider to him), AND for whatever calls he makes on the second...

...etc.) to be competitive in different areas.

THE CLIENT END

From the client side, conventional callback is a fairly kludgy proposition. You have to place the code call from a prearranged location. You have to wait for the callback. You (usually) have to identify yourself (by punching in a PIN code). Then, presuming you want to make several calls during the callback session, you have to drive a user-interface (by pressing etc.) that terminates each call and re-acquires dialtone. The IVR systems involved vary widely in quality, reliability and elegance of design. Your callback leg is vulnerable to line noise, talk-off, etc.

That's just when you're...

...a single-fine phone (i.e., one that you control, and that can receive the callback call, directly). Office and hotel phone systems present another class of problems. How does the...

...pricing and service plans, and British Telecom's partnership with NYNEX), the hassles of traditional callback make it look less and less attractive.

In the short term, part of the answer has been to facilitate access by developing equipment that manages the callback process for clients. Generally, such equipment dials the phone to make the "code call," hangs up the telco side while holding the client -side line open, waits for the callback call, answers, and closes the loop. The client need only activate the process, then hold...

...is acquired. Variations (e.g., the client hangs up and gets rung back when the callback call is received) also exist. Hardware ranges from personal computer peripherals, to trunk-based black...

...IVR equipment.

Development of client-side mediation equipment has also opened up new markets for callback. Foreign hotels, for example, now frequently employ Stateside callback providers to offer reduced international phone rates as a value-added service to customers. The...

...station-side system, assisted by the switch) identifies the call as international, records the number, calls the U.S. service provider, hangs up, waits for callback, manages the user interface, and dials the call originally...

... Load" also appear in the interpreter window.  
As with UIM/X, OLE also automatically inserts code in each callback  
to access the context structure. Both UIM/X and OLE generate structures...

...widget within the top-level hierarchy is accessible via this structure.  
The context-structure support code is always created in every callback ,  
but you need not use it. Regardless of whether you do use it, it imposes a  
fair amount of processing at the beginning and end of each callback  
call . As with UIM/X, OLE usurps the callback 's client data to support  
passing this structure to the callback , rendering it unavailable for  
other use.

As with UIM/X, OLE cannot have multiple callbacks of the same  
callback type for a given widget, nor can multiple widgets share the same  
callback . Generated Code

OLE's generated code is superb. As with UIM/X, it offers the  
potential benefits of parametric interfaces and multiple instances of both  
widgets and hierarchies.

Organizationally, all the code appropriate to all the widgets in a  
given hierarchy is placed in the same C source file. This includes all  
creation, callback, and support code present for each widget. For very  
complicated hierarchies, this could result in very large files...

... a telephone and a PC can dial a host resource, log-on via a compromised password, and access confidential data. Hackers easily break password security using self-created programs that loop on every combination and permutation of characters, redialing for each new permutation until the password is found.

Access control devices block access to network resources by intercepting dial-up calls. They request an access code from the caller, terminate the call, and validate the code and its assigned telephone number that reside in a directory. If the code is found to be valid, the device calls the assigned number, which, in the case...

...the number of the hacker's telephone. Breached passwords are of no value since the callback telephone must be the one assigned to the access code. These devices are readily available...

...be valid, Line Guard dials the telephone number of the authorized user of that access code. If it is the same number as the original call, the caller is allowed access to the host.

The Line Guard responds to an invalid access code by allowing the caller to reenter the access code with a time-out. If the reentered code is also found to be invalid or the time elapses, the Line Guard terminates the call and increments the count of invalid calls. A passthrough option connects the caller to the resource on access code validation, eliminating the aggravation of waiting for the callback. Passthrough, however, offers no more security than a password.

The network administrator can update or alter the unit's directory of access codes and...

...not possible. This two-call process gives the verified caller, on the initial call, a code sequence that defines the port number that the

caller is to use and a temporary ID code to access the resource. The user is given access to the defined port for a...

...must be placed.

LeeMah incorporates a patented feature that it calls LineLock on its TraqNet callback devices. The feature safeguards access from a caller who remains on the line to intercept the dialback call, since dial connections remain active for several seconds after either party hangs up. Line-Lock listens for a central-office tone that indicates the caller has terminated the call before it initiates callback. This vital feature prevents a hacker with the user's access code from gaining access to protected resources by waiting on the line until the device validates the code and dials the user-assigned telephone number.

A further enhancement to dial security is implemented...

...The models store up to 400 passwords and telephone numbers, and provide three levels of password response. A valid password, entered by the caller following a password request prompt issued by the host-connected modem, can initiate passthrough to the host, callback to the stored number, or callback to a user-entered number, depending on the selected security mode. The modem terminates the call in each callback mode and redials the stored number or the user-entered number.

Additional security is provided...

...modem to prevent access of the host resource by the calling modem. In addition to callback security and master key exchange, the modems offer a DES option to prevent access to...

...and security parameters can be downloaded from Telcor's PC-based Network Administrator System. Local password entry is also permitted, provided that users "sign on" before outdialing or attempting to reconfigure...

... not connected.

Users calling in with modems have to go through the same two-level password obstacle. And to battle even more against would-be hackers who somehow figure out or know the passwords and dial into the system, most sophisticated switches will hang up and then call back a stored telephone number for that particular password.

It's done by "call - back" modems. These suckers can have a bunch of neat security features, including the ability to call - back only during certain times of the day or certain days of the weeks.

\* SMDR. You...

...SPECIFICATION a route list based on a "CarrierID". The "CarrierID" can be determined through the authorization code or the ANI associated with the call. The SCF, based on the ANI (or authorization code), reads the route list associated with the subscribed CarrierID and returns routing information to the SSF. The SSF routes the call back to the home switch 132 with terminating routing information.

ANISR allows routing information to be dependent upon a number of factors. First, ANISR can support call Type routing where terminating route lists are based on the type of call, as shown in Figure 11. The...

...SPECIFICATION flash at an increasing rate as the number of un-answered incoming calls increases.

Automatic Callback

Initiate Automatic Callback

To initiate automatic callback when the called station is busy:

1. Depress the RECALL key.
2. Listen for distinctive dial tone (a high tone followed by normal dial tone).
3. Dial the automatic callback access code.
4. Successful setup is indicated by three bursts of dial tone.
5. Hang up the phone and wait for ringing.
6. Answer the call and receive ringback tone. This indicates the ringing of the called station.
7. An answer connection is made to the called party.

Cancel Automatic Callback

To cancel automatic callback :

1. Dial the cancel automatic callback access code.

2. Successful cancellation of automatic callback is indicated by three bursts of dial tone.

Call Forwarding

To have all calls to...

...routing code):

1. Dial the call forwarding access code.

2. Dial the call forwarding condition code .

Possible condition codes are:

0 = Forward no calls.

1 = Forward all calls if the station...

Detailed Description

Detailed Description  
... procedure with the local call manager 60.

This is involves the call notification apparatus 80 calling back the local call manager 60 and passing an identity code to the local call manager. If the identity code corresponds to the identity code of the called party with whom the user 3 is trying to establish the communication...

...call manager issues a call accept signal to the apparatus 80. The apparatus 80 then terminates the call with the local call manager and generates a notification signal to the user 1 to...

Detailed Description  
... wireless communications system, which sends the audit message to the  
wireless transmitter. The wireless Location System can also force a  
call termination (hang up) and then call the wireless transmitter back...

...The call can be terminated either by verbally instructing the mobile  
user to disconnect the call , by disconnecting the call at the  
landline end of the call , or by sending an artificial over-the-air  
disconnect message to the base station. This...

...air disconnect message simulates the pressing of the "END" button on a  
mobile unit. The call - back invokes the above-described paging  
sequence and forces the phone to initiate two transmissions that...

...be summarized. First, an initial location estimate is made. Next, the  
above-described audit or " hang up and call back " process is  
employed to elicit a responsive transmission from the mobile unit, and  
then a second location estimate is made. Whether the audit or " hang up  
and call back " process is used will depend on whether the wireless  
communications system and wireless transmitter have...

... a route list based on a "CarrierID". The "CarrierID" can be determined through the authorization code or the ANI associated with the call. The SCF, based on the ANI (or authorization code), reads the route list associated with the subscribed CarrierID and returns routing information

to the SSF.

The SSF routes the call back to the home switch 132 with terminating routing information.

27

ANISR allows routing information to be dependent upon a number of factors.

First, ANISR can support call Type routing where terminating route lists are based on the type of call, as shown in Figure 11. The...

... of the source of  
the phone call, namely telemarketer phone 24, to generate  
the deregistration call back feature of the CLD 100.

When a telemarketing call is originated on telephone  
24 and...

...100 on line 28, it is routed to  
consumer phone 10 through router 104. After hanging up  
from the call received by telemarketer phone 24, if the

Ginger R. DeMille

consumer enters a code on keypad 112 of consumer phone 10, the entered code is transmitted on line 12 to CLD 100.

Code receiver (CR) 114, which is coupled...Figure 5, there is shown a flow diagram demonstrating a method for performing a deregistration call back. The method includes storing the caller ID of the caller after a call is received...  
...After storing the caller ID, the called party line is monitored to determine if the call has terminated, or more specifically, whether the called party phone has transitioned to an idle state (step 510). Once the called party phone has transitioned to an idle state, a code receiver is connected to the line to monitor the line for

The method for setting up voice communications between a computer operator and an agent working for a partic. business involves the operator inputting a call request after viewing advertising information placed by the service provider on a computer network. A call request is made from the computer by a push-button facility to a telephone switching system connected to the service provider.

Voice communications are set up between an agent for the service provider and the computer operator via the telephone system using an automatic dialling facility. The call request may be transmitted from the computer over the Internet.

ADVANTAGE - Allows quick access by service provider operator to interested customer using telephone and automatic call distributor.

Patents; A patent lawyer wins protection for a product intended to help  
others win protection for theirs.  
Sabra Chartrand  
New York Times, Late Edition - Final ED, COL 01, P 2  
Monday May 1 2000

TEXT:

PATENTS that cover methods of doing business may be controversial, but perhaps only one patent is genuinely redundant. A Dallas company has won a patent for a method of applying for a patent.

The company, Kernel Creations Ltd., says this is the first time the patent and trademark agency has awarded a patent for a technology for preparing a patent application. And it says that inventors have already been awarded patents based on applications prepared using the software.

There are any number of how-to and do-it-yourself books and manuals offering inventors guidance through the patenting process. There are videos and software that advise applicants. Some people are skilled enough in the arcane language of patent applications to prepare their own; they can even produce technical drawings that meet the exacting standards of the patent and trademark agency. But applying for a patent is an ambitious undertaking that requires knowledge of patent law, agency regulations and examiners' procedures, as well as a draftsman's steady hand.

If anecdotal evidence is any measure, many inventors who submit their own applications end up turning to a patent attorney or agent after their documents are rejected as inadequate. That requires the inventor to explain his invention to the attorney so the application can be made as legally binding as possible. And the lawyer's expertise costs money.

James D. Petrucci says inventors can avoid some of that trouble and expense with his software. Mr. Petrucci is a patent attorney himself -- but he does not believe his invention will harm those in the business.

"We found in our practice that a lot of people don't have the resources to pay a patent attorney to go through the process, and they're being cut out," Mr. Petrucci said. "This software enables a lot of people to get into the system and apply for patents."

He also thinks the software will enable patent lawyers to avoid complications that can arise when they try to write a patent application without enough consultation with the inventor.

"I've seen many patents drafted by attorneys, and once they got into litigation, I saw that the inventor was not involved in the drafting process, and that caused problems down the road," he explained.

The software divides the task of writing a patent application into sections.

"A patent application is sort of like a short story, not a fill-in-the-blanks process," Mr. Petrucci said. "The software takes you through the sections of the application to build an entire document. It starts with a central analysis of the invention, and from that it generates other fields, claims and abstracts."

"The real key to the patent and the process is the fact that the sections are interlinked. As you do Section 1, it creates something in Section 2, and 1 and 2 build Section 3. As you go through it, it builds the format commonly used in patent applications, and then you can go through and edit it."

The software draws words from the inventor's title and primary descriptions to write the application in the prose and format particular to the United States Patent and Trademark Office.

"When you think about a patent, 95 percent of it is a technical description of the invention," Mr. Petrucci said. "That doesn't require legalese, but for the inventor to disclose what the invention is, how it works, what are the significant modifications. We really push the fact that the claims need to be written in a clear manner."

The company is already selling the software under the name PatentPro ([www.4patpro.com](http://www.4patpro.com)).

"A lot of people use the program to prepare a draft application and give it to their patent attorney and reduce costs," Mr. Petrucci said. He and his partner, Robert M. Mason, won patent 6,049,811.

**For Online Shoppers, A Call-Back Feature**

Thousands, and possibly millions, of people went shopping online for Christmas gifts and other holiday gifts last winter, proving the attraction of buying by computer. Those shoppers encountered some new business methods, like one-click buying, that have set off fights over who owns e-commerce technologies.

Now the Rockwell International Corporation, which builds customer contact products like those used in airline call centers, has won a patent that is aimed at adding another customer convenience to online shopping. The patent allows a Web site to display a "call me" button so people can choose a time and place for a customer service representative from an online business to call them.

The invention is already in use on the Internet, but Rockwell's vice president of development, Roger Sumner, does not think the patent will generate the disputes that have arisen around Amazon.com's patent for one-click shopping.

"If you look at when the product was first introduced, and when the patent application was first filed, the method certainly wasn't in the public domain and wasn't something you often saw," he explained.

Rockwell began designing the technology in the mid-1990's. "Web site design was still fairly immature," Mr. Sumner said, "and people would get to a dead end, couldn't get the information they wanted, and needed to talk to a person."

Researchers began to design a call-back system that would allow a customer to choose a range of times for receiving a call. After providing a name and phone number, the customer could choose to be called immediately or at a predetermined time, from five minutes later to a different day.

"Basically the patent covers the method for creating software that conducts a call-back function based on Web interaction," said Mr. Sumner, who is also the company's chief technology officer.

"People still feel a need to talk to a live person to complete a transaction," Mr. Sumner said. "Even in today's environment, where companies have become extremely good at Web site design, customers still get roadblocked, lost, or feel a need to talk to an individual."

The inventors, Anthony J. Dezonno and William R. Quayle, won patent 5,991,394 for Rockwell.

Security devices prevent the compromise of network resources.

Axner, David H.  
Networking Management, v8, n2, p56(6)  
Feb, 1990

TEXT:

Security devices prevent the compromise of network resources  
Communications is the lifeline of the business environment. Secure  
communications is vital to its health. The business environment conducts  
its business over communications links that form networks interconnecting  
user workstations, PCs, and terminals with host resources. Business  
transactions, file transfers, electronic mail, electronic document  
exchange, graphics, facsimile, and other forms of message and data  
communications are continually transmitted throughout an enterprise or  
among several enterprises.

Since these links interconnect users and host resources, they are  
vulnerable to attack from external sources, such as hackers, eavesdroppers,  
and even criminals who may intercept transmitted data or messages, or  
access a resource for their advantage. Over the past few years, there have  
been many accounts of resources sabotaged by viruses introduced to networks  
by depraved or unscrupulous individuals.

Networks have become the Achilles' heel of the business environment  
because of their vulnerability to security breaches. Users must be alert to  
this growing menace to business operations and should implement preventive  
measures to secure their networks. Potential network break-in points exist  
from one end of the link to the other and include the terminal and its  
modem or DSU/CSU, various points along the link, and the destination modem  
or DSU/CSU. The physical link path can easily be breached since it normally  
lies outside of the protected domain of the business operation.

Securing a network appears to be no simple task; however, strong  
security measures can be implemented by installing available network  
security devices.

Encryption and access control are the two principal methods that are  
currently used to prevent security violations. Encryption is the older and  
more widely used of the two. Traditionally, it has been implemented by  
world military organizations and governments since the inception of  
communications via transmission media to safeguard highly secret or  
sensitive information.

Encryption safeguards data from interpretation by making the  
transmitted data unintelligible, but it does not restrict access to the  
data. Access control measures, on the other hand, guard network resources  
by preventing unauthorized access. Access control attempts to verify a  
user's identity before allowing the user to gain access to a resource. The  
two security methods complement one another and are more effective when  
combined.

The most vulnerable link in a network is a dial-up line. Anyone with  
a telephone and a PC can dial a host resource, log-on via a compromised  
password, and access confidential data. Hackers easily break password  
security using self-created programs that loop on every combination and  
permutation of characters, redialing for each new permutation until the  
password is found.

Access control devices block access to network resources by  
intercepting dial-up calls. They request an access code from the caller,  
terminate the call, and validate the code and its assigned telephone number  
that reside in a directory. If the code is found to be valid, the device  
calls the assigned number, which, in the case of a hacker, would be  
different than the number of the hacker's telephone. Breached passwords are  
of no value since the callback telephone must be the one assigned to the  
access code. These devices are readily available for under \$1000 per line.  
Line cost diminishes sharply for devices that support multiple lines and  
for quantity orders with discounts.

Western Datacom's Line Guard represents a typical callback system.  
It connects the modem and host at the central site and provides host port  
protection. Access codes and telephone numbers of authorized users are  
stored in a directory. A user who requires access to a host protected by

the Line Guard must dial the host and enter an access code in the telephone's Touchtone keypad when issued an entry request by the Line Guard.

When the Line Guard receives the code, it terminates the call and checks the validity of the access code by comparing it with the codes/telephone numbers contained in its directory. If the access code is found to be valid, Line Guard dials the telephone number of the authorized user of that access code. If it is the same number as the original call, the caller is allowed access to the host.

The Line Guard responds to an invalid access code by allowing the caller to reenter the access code with a time-out. If the reentered code is also found to be invalid or the time elapses, the Line Guard terminates the call and increments the count of invalid calls. A passthrough option connects the caller to the resource on access code validation, eliminating the aggravation of waiting for the callback. Passthrough, however, offers no more security than a password.

The network administrator can update or alter the unit's directory of access codes and telephone numbers, and download them from the host or enter them from an attached terminal. Line Guard also maintains an audit trail of all calls for user inspection.

Digital Pathway's Defender II System enhances the basic operation of access control devices. In addition to callback and passthrough modes, it provides a programmed callback mode and a second callback mode called controlled dial-through access. The programmed callback mode, sometimes called variable callback, applies to the mobile user whose telephone number may change periodically. The user enters the current number along with the access code. When the access code is validated, the user is called at the number provided, which is used only for the one call. Additional calls by the user will revert back to the number retained in the data base.

The controlled dial-through access applies to conditions in which callback is not possible. This two-call process gives the verified caller, on the initial call, a code sequence that defines the port number that the caller is to use and a temporary ID code to access the resource. The user is given access to the defined port for a predetermined time period during which the call must be placed.

LeeMah incorporates a patented feature that it calls LineLock on its TraqNet callback devices. The feature safeguards access from a caller who remains on the line to intercept the dialback call, since dial connections remain active for several seconds after either party hangs up. Line-Lock listens for a central-office tone that indicates the caller has terminated the call before it initiates callback. This vital feature prevents a hacker with the user's access code from gaining access to protected resources by waiting on the line until the device validates the code and dials the user-assigned telephone number.

A further enhancement to dial security is implemented by an authentication device, which is used by the authorized caller. The device is targeted at mobile applications where the caller may be calling from a public telephone on the road, or from a motel room. The device connects the modem and line and sends a unique code to the host callback device, which validates the received code to determine whether the call is authorized. This method eliminates the callback mode, connecting the caller once the unique code has been validated.

LeeMah's InfoKey is a pocket-sized unit that passes the dialed number received from the modem and waits for a tone from the TraqNet system at the host end once the connection is established. When it receives the tone, the unit inhibits the modem and sends the access code and an eight-digit serial number to be validated by the host TraqNet system. If validated, the host TraqNet system sends InfoKey a challenge that InfoKey must meet with an authentication process.

The process uses the DES to create a unique number (changes with each call) that it sends to the host system. The challenge/response process authenticates the caller. Some other vendors, such as Digital Pathways (SecureNet Key), offer similar authentication devices, although the authentication process varies.

LeeMah publicly demonstrated the effectiveness of its InfoKey/TraqNet system for preventing security breaches by offering hackers a substantial reward for compromising the system. The company received some 7000 telephone calls from hackers responding to the invitation through a telephone number posted on electronic bulletin boards frequently used by hackers. None of the hackers were able to beat the system and retrieve a secret message residing in the host, which was located at the Atlanta office of contest auditor KPMG Peat Marwick. The odds against the hackers

were estimated at 720 quadrillion to one.

Callback security has been integrated with modems by several manufacturers. Telcor Systems Corp., for example, produces a family of high-performance, Hayes-compatible, dial-up modems that provide callback security and master key exchange with the DES as an option.

The models store up to 400 passwords and telephone numbers, and provide three levels of password response. A valid password, entered by the caller following a password request prompt issued by the host-connected modem, can initiate passthrough to the host, callback to the stored number, or callback to a user-entered number, depending on the selected security mode. The modem terminates the call in each callback mode and redials the stored number or the user-entered number.

Additional security is provided by end-to-end Telcor modems. The modems exchange 17-digit master keys when they connect. A key mismatch causes the central-site modem to prevent access of the host resource by the calling modem. In addition to callback security and master key exchange, the modems offer a DES option to prevent access to sensitive data. Configuration and security parameters can be downloaded from Telcor's PC-based Network Administrator System. Local password entry is also permitted, provided that users "sign on" before outdialing or attempting to reconfigure the modem.

Cryptography is the science of message scrambling/descrambling to ensure unintelligibility to all except the intended receiver. Data encryption employs cryptographic methods to achieve the desired results, but it must also ensure that the received message is not a forgery. Data encryption uses an encryption algorithm and a key. The algorithm defines a general method of encryption and may be common knowledge. However, the encryption key, known only to the sender and receiver, is essential to enciphering or deciphering the data.

Unencrypted data, called plain text, is translated into encrypted data, which is called cipher text, via an encryption algorithm. The key determines the exact procedure that the algorithm uses to encipher/decipher the text. One or two keys can be employed to encipher/decipher data. The single-key approach, called symmetrical, uses the same key to encipher and decipher data. Two keys, each unique, are used in the asymmetrical method, which employs one key to encipher the data and the other to decipher it. The two-key encryption process makes it more difficult to "crack" the enciphered data.

Many public and proprietary encryption algorithms were (and continue to be) used before the introduction of an encryption standard. The DES was developed by IBM and approved as an encryption standard in 1976 by the National Bureau of Standards, which has since become the National Institute of Standards and Technology. The standard is now in general use by virtually all U.S. manufacturers of encryption products.

The DES is a symmetrical algorithm that requires identical keys for enciphering and deciphering. It employs a 56-bit encryption key, and its algorithm uses 16 iterations of a combination of text rearrangement and substitution.

One commercially available product that uses the DES is offered by a leading datacom vendor, Racal-Milgo. The Datacryptor 64 is a protocol-transparent, link encryption device for point-to-point, multipoint, dial-up, or dedicated networks. Unlike end-to-end encryption, which only enciphers the actual data within the transmitted block, link encryption also enciphers all overhead characters, such as message headers and trailers.

The Datacryptor supports synchronous data rates at speeds of up to 64 kbps and asynchronous data rates at speeds of up to 19.2 kbps, and connects terminal and modem at remote sites and host and modem at the central site. It features key indexing and downline loading of key variables, and storage for up to 400 keys. Indexing is selectable. Keys are indexed automatically via a timer or manually.

Battery backup of key and configuration memory is provided for a duration of up to 10 years. The unit complies with ANSI X9.17 and is contained in a tamper-proof, modem-sized cabinet. Front panel parameter selection controls are protected by pick-resistant, dual-function locks.

A special version of the Datacryptor 64, the Datacryptor 64-1027, meets the security requirements of Federal Standard 1027, which is for unclassified national security-related data. Key variables for up to 226 keys can be entered via either a tape reader or key loader, which are both accessories.

Racal-Milgo also offers a Key Management Center (KMC) that manages a network of Datacryptor devices, providing centralized control and key

management. The KMC consists of a customized Compaq 386/20 PC with two printers and a Datacryptor 1027KC. It complies with Federal Standard 1027 and ANSI X9.17 (plus a Racal-Milgo extension of X9.17 called Key Transfer) and features automatic (pre-timed) or manual key indexing, and downline loading of key variables.

The network administrator can perform all key changes, key verifications, and key erasure (zeroization) from a central site. The KMC supports two-level user authentication, user name and password protection, and lockout on maximum failed log-on attempts. Its management features include cryptographic alarm and error reporting, key status, operating mode control, configuration downloading, diagnostic testing, continuous events logging, and report generation.

The secure transmission of data over LANs or between LANs is another application that some manufacturers of network security devices have targeted. Digital Communications Associates' 10Net Secure LAN operates in conjunction with the 10NET Plus LAN operating system and all 10NET hardware platforms. The nucleus of the system is an encryption card that is inserted in a stand-alone or networked PC. Data is encrypted as it is written to the PC's hard disk and diskettes, and also as it is transmitted over the network. Encryption key management facilities are provided by the software extension to 10NET Plus software. Multilevel file access and full audit trail of user activity are also provided by the software.

Cryptall's 3000 Series Ethernet LAN Bridge ensures secure transmission of data between geographically dispersed LANs over wide area links such as leased lines, DDS, T1, microwave radio, or fiberoptic cable. The automatic learning bridge operates at 10 Mbps to facilitate a wide range of link rates. Transmission between 300 Series LAN bridges over the WAN link is encrypted to ensure privacy. Encryption complies with the DES and with ANSI standard X9.17 for fully automated by management.

Link security is the specialty of Cylink, which provides a number of link encryption products that address a wide range of data transmission applications, from asynchronous or synchronous operation over dedicated and dial-up lines, to synchronous operation over T1 or T3 links. Cylink also supports secure voice communication. Cylink has a proprietary key management system that is called Secure Electronic Exchange of Keys (SEEK), which is based on a prominent encryption algorithm. Both units using the SEEK method randomly generate and store secret numbers, which are not accessible to the user or transported over the network. These secret numbers are then used to calculate public numbers via an exponentiation modulo-p calculation.

The public numbers are exchanged between units, and each unit raises the received public number by its own secret number to produce the shared secret number. This number is used to create data encryption keys, which comply to the DES. A block of data encryption keys is transferred between encryption devices. The SEEK method is an extremely secure key management method because it uses a complex method to encrypt keys.

Link encryptors can range in price from as little as \$500 per end to several thousand dollars per end, depending on the complexity and the degree of security provided. Not all data encryption products employ the DES algorithm. Some use extremely complex algorithms and several keys for both key and data encryption. The prospective user must carefully evaluate these products with respect to the target application to ensure that the equipment cost and the protection that it provides is justifiable.

Message authentication verifies that the received message is genuine and has not been altered in transit. It is vital to such critical applications as electronic funds transfer (EFT), since it guarantees authenticity. Message authentication is implemented by appending a special code called the message authentication code (MAC) to an enciphered or clear text message. Some applications may not require the actual message (such as funds transfer) to be encrypted, since its value to unauthorized personnel may be negligible. The MAC is generated from the message contents and is, therefore, unique to the message. An altered message will produce a different MAC when received, which makes it evident to the recipient that tampering has occurred to the message content during transmit. A MAC standard has been developed as ANSI X9.9 (FIPS 113).

Jones Futurex, a producer of data encryption boards for installation in IBM PCs, offers a MAC card (MAC 310) that conforms to ANSI X9.9 and FIPS 113, and is certified by the U.S. Department of Treasury as meeting the requirement for authentication of EFT. The card, enclosed in a steel jacket, features tamper detection, which destroys stored keys if the board is removed from the PC or the jacket is removed from the board. The MAC card supports up to 16 users, each with access to 23 crypto keys that are

unique to that user.

In a typical application, an IBM PC AT, loaded with multiple MAC cards and attached as an intelligent peripheral to a host, can perform message authentication for networked PCs, each containing a MAC card. Messages received by the host from the remote PCs would be sent to the AT for message authentication.

Access control, data encryption, and message authentication offer users sound protection against unauthorized access of resources. Each of these methods targets a different aspect of network security. When combined, they offer considerable resistance to security breaches. These network security devices are not expensive in unit quantities; however, they can considerably impact the communication budget if they are required to protect numerous links and resources in a large network.

Users may be reluctant to pay the extra cost for protection if security breaches have been negligible or nonexistent. Also, if the total cost of security breaches is less than the outlay of funds for network security devices, the added cost may be considered unjustified. This reasoning may be logical for noncritical applications where a security breach may not interfere with a company's business or create catastrophic results, yet it could be expensive should a security breach result in a considerable loss, such as the destruction of a company's data base.

Users must weigh the potential loss from a possible security breach against the cost of securing their network to determine the justification for expenditures for network security. Unsecured links critical to daily operation are an open invitation for security violations.

David H. Axner is manager of data communications for Management Information Corp., Cherry Hill, N.J. He has authored numerous industry-related articles and analytical reports.

TEXT:

Access and Authentication: Key Issues in Network Security

The proliferation of personal computers and the rapid expansion and increasing complexity of modern networks has made corporate communication resources increasingly vulnerable to external threats. It is essential to protect these vital resources from unauthorized users, intruders, hackers, viruses and other perils. Since communication links and personal computers provide users with an access path to corporate resources, security measures to safeguard these resources must be strategically implemented.

The responsibility for protecting communications resources typically falls on network managers. Attention can be focused on three essential categories of activity: restricting access to the network and computer resources, restricting access rights to specific resources and protecting the information that passes through the networks.

Network Vulnerability - It's Everywhere

Enterprise-wide networks are vulnerable to security breaches from one end to the other. Any accessible point on the physical communication link that is external to the protected domain of the computer center is a potential break-in point. This includes LANs; LAN servers; LAN internetworking equipment, such as bridges, routers and gateways; and transmission equipment, including multiplexers, modems, CSU/DSUs, cables and wiring closets that are not physically located in a protected environment. It also includes all remote LANs and transmission equipment.

Network equipment can be secured in a safe environment; however, the physical links between remote locations - i.e., telephone lines, fiber cables, microwave links and satellite links - are virtually impossible to secure. They are vulnerable to undetected line taps and severed links. Therefore, security measures such as encryption and redundancy must be implemented to protect the information from eavesdroppers and to insure uninterrupted communication.

LAN Security

The approach to network security in the LAN operating environment is different from that for WANs. Except for their external communication links, LANs usually reside within corporate boundaries that can be controlled by the network manager or LAN administrator and are thus relatively easy to secure.

Although computer viruses and the like can pose a serious threat to LAN networks, the major concern of the LAN manager should be to protect LAN resources from unauthorized users. The vast majority of LAN security violations are caused by current and former employees. Therefore, a central objective of a LAN security program should be to prevent the access to and manipulation of unauthorized LAN resources by employees, and to restrict resources and access rights allocated to authorized users.

LAN operating systems, as well as software for servers and routers, address network security by controlling or restricting physical access and access rights to LAN resources. Network managers and administrators allocate specific LAN resources and access rights to authorized users based on a user profile that contains information such as user category, workstation designation and resource needs.

Access control can include several user categories, depending on the level of authorization or privilege. For example, Novell Netware supports privilege levels that can be assigned to the network administrator, console operator and users. Each of these privilege levels provides different access rights; while the LAN administrator typically is given rights to access and manipulate all directories and files, the access of authorized users is restricted to specific files. User access can also be restricted to specific workstations, days and time.

Novell's newer Netware 386 network operating system provides LAN managers or administrators with a set of flexible access rights that can be

assigned to users at the file and directory levels. The LAN administrator can selectively assign access rights that include the ability to read, write, open, create, delete, search and modify files in a directory; the ability to create, delete or rename subdirectories in a directory; and the ability to set access rights in a directory and its subdirectories. Each of these rights can be denied or granted to a user for individual directories.

Under NetWare 386, each file also can be designated as shareable or nonshareable, read-only or read/write, or execute-only to further control access rights. The operating system also has a feature that Novell calls an "inherited rights mask," which denies assigned rights instead of granting them, and it is used to control access rights in a subdirectory. For example, if a user is granted the right to create or delete files in a directory, he or she can be denied that right in a subdirectory.

Another important aspect of access control is user authentication, which requires the user to enter his or her name and password in addition to the requested resource when logging in. Additional security can limit access to a user based on location, date and time; for example, a user may be granted access to a resource only during designated hours on specific days of the week. Access control can also be used to restrict dial-out facilities from remote users of local area networks, thus reducing the likelihood of unauthorized users, intruders and hackers gaining access to the company's telephone facilities.

Each LAN user must be identified through a logon procedure that requires the user to enter a personal ID or password; access restriction is based on the identity of the user and the resources that are allocated to that specific user. If choice of a password is left to the individual users, they should be instructed to associate it with personal or abstract information that is unknown to others in the organization - in other words, don't use a common nickname. Password selection and usage should be based on the following guidelines:

1. Do Not Use Proper Names: They're just too easy to guess. Simple passwords invite compromise and offer little or no security.
2. Use Multi-Character Passwords: These are more difficult to compromise than passwords of just a few characters, such as a person's initials. The words in multi-character passwords should be unrelated - i.e., they should relate to different subjects. Mixing letters, numbers and, if allowed, symbols makes passwords even more difficult to guess or crack.
3. Change Passwords Frequently: The frequency of change should depend on need, and could be once per day, week or month. They can be either created by the administrator or randomly generated by software, in which case they can consist of meaningless character strings.
4. Never Disclose a Password.
5. Never Record a Password.

Another essential element in LAN security is the audit trail, which provides an account of all network transactions that have occurred over a specific period. For example, the 3Com's 3+Open LAN Manager audits all resources on the LAN server, including directories, files, and print and communication queues.

The audit trail gives the LAN administrator a complete record of network activity, such as the number of resources in use, the users who are accessing these resources, session time, idle time and other key statistics presented by the session management window. It also alerts the administrator to unauthorized attempts to access network resources. The LAN administrator can determine the specific LAN resources to be audited when he or she is configuring the LAN server.

Diskless servers and workstations can also substantially improve network security. They eliminate the opportunity for users to accidentally or deliberately introduce diskette-based viruses into the LAN environment, prevent the uploading of unauthorized software from diskettes, and prevent the downloading of copy-restricted files or data on user diskettes. Furthermore, a server without keyboard prevents accidental system rebooting, which can interrupt network activity. The network manager or administrator can make configuration changes and other alterations from a LAN station keyboard.

Obviously, important files should be backed up periodically to prevent the possibility of losing data. Tape backup is an excellent method, since it is fast and does not delay operation. Disk mirroring - recording data entry on two disks simultaneously - is another backup method.

#### Encryption

Secure communication is vital to applications such as financial and credit transactions, payroll, marketing/sales strategies and certain

government activities; the results could be disastrous if the information were intercepted by the wrong people. By "scrambling" the information, you can make your messages unintelligible if intercepted.

The more formal name for scrambling messages is cryptography. Cryptography involves encoding or "enciphering" the data before it is sent, and "deciphering" the data at the receiving end. Encryption/decryption employs an encryption algorithm and a key. The encryption algorithm determines the process for encrypting data; the key, a specific bit pattern that is varied from one key to another, is used to encipher data and decipher encrypted data, and it is known only to the sender and receiver. Information security is more dependent on the key than on the encryption algorithm, and keys can be changed periodically to ensure tighter security.

There are two methods commonly used for encryption/decryption keys: symmetrical and asymmetrical. The symmetrical method uses a single key for encryption and decryption; i.e., both keys are identical. The asymmetrical method uses different keys for encryption and decryption. The symmetrical method provides tighter security since only one key can be used to decipher a message.

Encryption algorithms are usually proprietary, but in 1976 the National Institute of Standards and Technology (NIST), formerly the National Bureau of Standards, approved the Data Encryption Standard (DES) that was developed by IBM. The DES is a symmetrical algorithm; i.e., it uses the same 56-bit key for encryption and decryption, and the algorithm uses 16 iterations that combine text substitution and rearrangement.

DES is now an ISO standard, and it is used in the U.S. to protect unclassified data. Equipment using the DES algorithm is available to users in foreign countries who apply for and receive a DES license from the U.S. State Department.

It can be implemented either in hardware via commercially available chipsets or in packaged software. Some hardware versions run at up to T1 rates, but the software-based versions are slower. The security of the DES algorithm has been proved, but since DES is 15 years old, it is threatened by ever faster and more powerful computing devices and will probably be replaced during this decade.

The process of key management includes key generation, storage, distribution, selection and destruction. There are several methods for key management, which vary based on the cryptographic system in use. The industry standard for key management is ANSI X9.17, which improves on conventional DES key distribution methods by using a 112-bit key instead of the DES 56-bit key. Public key management systems include SEEK (Secure Electronic Exchange of Keys) and RSA (named after its inventors Rivest, Shamir and Adleman). The SEEK method is one of the more widely used public key management methods in current usage and is incorporated in Cylink encryption products.

Encryption applies to any form of communication: data, facsimile, video, voice, etc. It can be used to protect communication end to end, over any transmission medium. Sensitive information transmitted via facsimile, traditional forms of data communication and conventional telephone calls can all be secured through encryption. This includes data sent from a LAN station or server, which can be encrypted via server software or hardware plug-in modules. Data can also be stored in databases in encrypted form for additional security, then decrypted upon use.

Encryption products are available from several vendors. Table 1 (p. 64) presents a selection of products from a sample of prominent vendors. Many support the DES algorithm, while others provide proprietary algorithms that must be used at both ends of a secured link. The products are available as standalone units that connect between data terminal equipment (DTE), such as a terminal or PC, and data circuit-terminating equipment (DCE), such as a CSU/DSU or modem. They are also available as a circuit board that plugs into an expansion slot within a PC. Jones Futurex, for example, offers a family of circuit boards for IBM PCs and compatibles, and for IBM PS/2 systems with micro channel architecture. Since the transmission medium is transparent to enciphered data, there are no special requirements that must be implemented to support encrypted transmission.

[Tabular Data Omitted]

Communication between data terminal equipment over any type of communication link can be secured by connecting the data terminal equipment at each end to an encryption device, which is then connected to the link. Link encryptors are available that support a broad range of transmission rates and link types. These include applications for asynchronous transmission ranging from 7.5 to 19.2 kbps or synchronous transmission from 1,200 bps to 128 kbps over dedicated or switched links, or for digital

links running at DDS, fractional T1 or full T1 rates.

#### Access Restriction for Dial-Up Facilities

The most insecure link in a network is a dial-up line. The public dial network provides an access path to network resources for anyone with a PC and modem. Once the intruder places the call and logs on via a compromised password, the full range of network resources are placed at the intruder's disposal.

Access control devices protect a network from intrusion via the public switched network by hackers, corporate spies or others with devious intentions. These devices, usually referred to as callback devices, connect between the line to the public switched network and the dial-up modem, and answer incoming calls over the dial line.

When a callback device receives the user's keyed password, it hangs up the line, thus terminating the call. Then it attempts to validate the user password against an assigned user phone number residing in its directory. If a match is found, the device calls the user at the assigned phone number, which is not necessarily the number used by the caller.

Callback devices that do not insure that the switched connection between both parties has been "dropped" by the presence of a dial tone can be compromised by an intruder. Dial connections remain for several seconds after either party terminates a call. If the intruder remains on the line and the callback device restores the line to dial the validated number, the intruder has access to the guarded resource. LeeMah's TragNet, for example, prevents the unauthorized caller who remains on the line from intercepting the call and gaining access to a network resource. It listens for a central office tone that indicates the caller has hung up before it initiates callback. Digital Pathways uses a different approach: It calls the caller back over a different line.

Callback devices also produce an audit trail that documents all calling activity and can be used for call analysis and management reports. The audit trail provides call details, such as date and time of call initiation and termination, line number, caller ID number and call status, such as successful calls or false attempts to access the network. The audit trail can be printed or sent to a PC for analysis.

The vendor's report generation software on the user's PC supports the creation of reports from audit trail details. Reports can satisfy a range of applications, such as peak system usage, bill-back for on-line time and equipment diagnostics.

Telephone callback devices are available from several vendors, and Table 2 presents a sampling from prominent vendors. These devices usually provide more than one operating mode to accommodate different user applications. For example, sales representatives often have to call from different locations when visiting clients, and call-back may be restricted by a hotel's PBX. [Tabular Data Omitted]

These conditions can be overcome if the device offers a "pass-through mode," that provides access once the correct password is received. However, this mode reduces the level of protection. Another version of this mode accepts the number of the caller's telephone, which it uses to call the user after the password has been verified.

The callback approach to dial line security is also integrated in modems by some vendors, such as Telcor, Western Datacom and Western Telematic. Combining callback with modem functionality eliminates added equipment and reduces costs. However, users who have modems installed in their networks are not likely to replace them unless circumstances justify their replacement.

#### User Authentication

Verifying the identity of a user who attempts to access a network resource is essential to preventing unauthorized access of a resource. User authentication applies more to the remote caller than to a user of a local terminal or PC, although it can be applied to any network user. User authenticity can be established when the user enters a memorized personal identification number (PIN) and an access code.

Security Dynamics of Cambridge, MA, markets the SecurID card, a credit-card-size card that generates a pseudo-random pattern of digits that automatically change every 60 seconds. The user enters the number displayed on the card's LCD plus a memorized PIN to gain access to a network resource. The access control equipment at the resource end of the line stores PINs and performs authenticity checks for all incoming calls. This approach to user authentication satisfies the need to call from any phone and eliminates the need for card readers or similar equipment.

Other authentication devices use a challenge-response approach to identifying the user. Digital Pathway's SecureNet Key and LeeMah's InfoKey

are two such devices.

SecureNet Key is used with the company's Defender II and IID family of access control equipment. The pocket-sized device contains the user's PIN and a 64-bit key number that are unique to the assigned user. The SecureNet Key is not used until the user calls the computer and has been verified as an authorized user by the Defender callback device. The Defender then sends an eight-digit challenge number to the SecureNet Key.

The user enters the PIN in the SecureNet Key, which first verifies the PIN and then requests entry of the received challenge number from the Defender. The SecureNet Key uses the challenge number and the stored key number to generate a response number using the DES algorithm. The user then sends the displayed response number to the Defender access control equipment. If the Defender verifies the user's SecureNet Key response number, the user is connected and access is granted.

Infokey is used with LeeMah's TraqNet system. It is also portable and pocket-sized, but unlike the SecureNet Key, it connects the remote modem to the phone line. When the remote user dials a call, it passes the dialed number from the modem and waits for a tone from the TraqNet system at the resource end once the connection is made. Infokey responds to the tone by disabling the modem and sending the access code, which is entered by the user, and an eight-digit serial number to be validated by the TraqNet system. If the number is valid, the TraqNet system sends Infokey a challenge number that it must respond to with an authentication process. This process generates a unique number using the DES algorithm, and that number is returned to the TraqNet system, authenticating the user.

While these authentication methods identify a valid user, they do not identify the individual. Moreover, PINs and passwords can be compromised and used by unauthorized persons that gain access to authentication equipment. However, these authentication methods are sound and should be used to secure dial-up lines. They complement dial-back line security and have proved their value in the field.

#### Message Authentication

Critical applications, such as electronic funds transfer (EFT), depend on the integrity of the received information; a misplaced decimal point or added zero could cause chaos. The authenticity of the information must be guaranteed to insure that it is genuine and has not been altered in transit.

The industry standard for message authentication is ANSI X9.9.

Message authentication can be used with or without encryption, depending on the sensitivity of the transmitted information.

Message authentication uses the transmitted information and a secret encryption key to create a cyclic redundancy check (CRC) character, called a message authentication code (MAC) or digital signature. Unlike a CRC, which is affixed to each frame, the MAC is appended to the end of the message. The MAC is recalculated by the receiver and must match the received MAC to indicate authenticity.

#### Conclusion

To fulfill their responsibilities for network protection, network managers must have a sound understanding of security measures and the knowledge to implement them properly. They must evaluate their own network periodically for security limitations and violations, and be prepared to implement remedial procedures and measures. They should also pay particular attention to those environments that are exposed to viruses and hackers, such as connections to the public telephone network, research networks used by universities and other unsecured networks. Network managers need to work in concert with network planners and administrators to ensure that security becomes a key consideration in planning network development, alterations and expansion, as well as in administering and supervising network operation.

Network security doesn't happen by chance; networks must be properly safeguarded to prevent potentially catastrophic events. The hackers and viruses of the 1980s may be replaced by criminal activity and acts of terrorism in the 1990s. Vendors need to develop more sophisticated measures that are difficult to compromise, while customers should expand their awareness of the technical and administrative procedures that can increase network security.

**ABSTRACT:** The rapid spread of computers has created opportunities for fraud, theft of data, and just plain mischief on the part of so-called computer hackers. Computers are a chronic weak spot for most companies. Networks often contain almost every shred of information on a company. The entire database could be copied onto small disks without leaving a trace that anything had been taken. With today's telecommunications links, a hacker in New York can just as easily attack the Bank of Tokyo as the Bank of New York. According to Terence McManus of International Computers Ltd., the ultimate security system is for a company not to connect its computers to the outside world at all. But most would not find that an acceptable solution. Companies must take every precaution they can to guard their databases.

**TEXT:** The rapid spread of computers has opened up vast new opportunities for companies to grow their businesses and expand services in ways never before imagined. But this trend has also created opportunities for fraud, theft of data and just plain mischief on the part of so-called computer hackers.

This is a lesson one Hong Kong hotel learned the hard way when a hacker broke into its telephone system and used it to make US\$50,000 in unauthorised telephone calls. Most telephone PABXs have modems built in so that engineers can get into the system over the phone lines to fix minor problems without having to go to the site. This keeps systems running and lets the hotel continue making money from calls -- but it also gave a hacker access to the hotel's long-distance lines.

Computers are a chronic weak spot for most companies. Networks often contain almost every shred of information on a company. The entire database could be copied onto small disks without leaving a trace that anything had been taken.

The motivation for computer crime is strong. Computer company Racal-Datacom estimates traditional crime offers an average return of US\$15,000 per crime and carries a 30% risk of being caught. The average payoff for computer crime is US\$15 million with only a 3% chance of apprehension. It's as lucrative, and a lot safer, than robbing a bank. A series of high-profile computer crimes in the West attracted attention in the 1980s, but more and more Asian companies are coming to realise they too are vulnerable. In low-crime Japan, for example, computer security was not seen as important. But with today's telecommunications links, a hacker in New York can just as easily attack the Bank of Tokyo as the Bank of New York. 'They are beginning to realise that they are linked to the rest of the world,' says Tom Mitchell, vice president with Racal-Datacom. Nippon Telephone and Telegraph, for example, recently announced it would hire UK-based International Computers Ltd (ICL) to upgrade security.

But protecting your system can pose a serious challenge. 'The ultimate security system is not to connect your computers to the outside world at all,' says Terence McManus, product marketing manager and security expert with ICL. 'But most people wouldn't find that an acceptable solution.'

Most firms rely on a combination of identification codes and passwords. The problem is that there are only two variables, which well versed hackers can often defeat. Once the hackers get past the front gate, there is virtually nothing to slow them down within the system. It's almost like having a single guard at the entrance to a bank vault, with no one watching what people are doing inside, and no one guarding the exit. Another form of security is the dialback system. The caller enters his ID

and password, the system looks up the user's phone number, hangs up and then calls back. But this can also be defeated by programs that keep the line open, mimic a dial tone and then 'answer' after the system has finished dialing. The computer thinks it has hung up and called back the person at home, but in fact the line has never been cut.

Faced with this kind of trickery, 'token' technology has become increasingly popular. Much like using an ATM card, the user inserts a card or other token into his computer and then enters a password. Without the card, hackers can't get into the system.

Of course, making sure that outsiders can't get in is only one consideration. Financial institutions have used computers for fund transfers, payments and so forth for many years, but increasingly these days other companies are relying on computers for a wide range of transactions.

Companies involved in trade, for example, now often rely on electronic data interchange (EDI) to transmit documents such as bills of lading and letters of credit via computer. 'The growth of EDI means a lot more sensitive data is moving around the ether,' says Philip Naybour, regional general sales manager for Racal-Datacom.

Experts can detect a forged letter of credit, but how do you know if the information in an electronic signal has been intercepted and altered on its way to you?

To address this problem, software companies have developed encryption systems that convert documents into code that can only be translated on the other end. Some of these are quite simple, while others use extremely complex mathematical algorithms so that the formula used to generate the code changes every time you use it. 'Using e-mail, there is very little you can do to stop someone from reading your message,' says McManus. 'The only thing you can do is encipher it before you send it.'

As in other areas, the mechanics of computer security are only part of the solution. Management factors again play a key role in making an effective protection programme. 'I've seen passwords taped to the secretary's terminal,' says Mitchell. Management has to understand the importance of the security mechanism and its role on protecting the company's data assets, and make sure that staff treat the issue seriously.

ABSTRACT

PURPOSE: To call a caller telephone set after the end of talking by allowing a master set to store a number of the caller telephone set and an ID code of a called slave set when the slave set is busy and sending the code to the slave set.

CONSTITUTION: Suppose that a slave set 2(sub 1) is called by, e.g. a telephone set 5 when the slave set 2(sub 1) is busy, a busy pseudo tone signal is sent to the caller telephone set 5 and when the telephone number is inputted by the operator of the telephone set 5 successively, the telephone number is sent to the master set 1 via a wired line 3 and the master set 1 stores the telephone number (extension number) and the ID code tentatively. When the talking is terminated, the slave set 2(sub 1) sends a call termination signal to the master set 1, a registration telephone number is displayed on a display section 7 in this case and the call of the telephone set 5 of the telephone number is implemented automatically. Thus, the slave set calls back the caller telephone set after the end of talking.

Toshiba Strata CS Release 4.0 Server-Based Business Communication System  
Receives Rave Reviews From Early Users.  
Business wire, p0072  
Nov 16, 2001

TEXT:

Business Editors & High-Tech Writers

IRVINE, Calif.--(BUSINESS WIRE)--Nov. 16, 2001

Combining the Power of Desktop Computers with Advanced Telephony and  
Voice Processing Capabilities, Strata CS Version 4.0 Provides Expanded  
Client Interface and Advanced ACD Capabilities

Toshiba America Information Systems Inc., Telecommunication Systems  
Division (Toshiba TSD) today announced that its Toshiba Strata(R) CS  
Version 4.0 has received rave reviews from early users.

The Strata CS 4.0 is a significant new upgrade of Toshiba's popular  
business communication system for small to medium-sized companies. It is  
one of the first communication server-based business communication systems  
to support digital telephones and give users the ability to integrate all  
their business communications via voice, voice mail, or e-mail through a  
graphical user interface (GUI) on their desktop or laptop PC, or via a  
telephone handset.

Integrated Voice, Voice Mail, and E-Mail Increases Productivity

Beta user John Zeller, president of ATS Communications Inc., of  
Concord, Calif., said, "Having the Strata CS 4.0 has made a dramatic  
difference in the way we communicate with our clients."

Call handling is important to Zeller's 40-person team at ATS  
Communications, a leading data and communication services firm. "Having the  
visual mailbox on our PC screens allows us to have all our business  
communications displayed in one place. We can see calls as they come in and  
decide to take the call, route it to voice mail, screen it and pull it back  
out of voice mail, or send it to someone else," said Zeller.

Because Zeller's team spends most of their time servicing customers,  
being able to share both voice and e-mail messages, as well as record and  
forward telephone conversations, has greatly added to their productivity.  
Zeller said, "We like being able to add notes and forward voice or e-mail  
messages via e-mail to each other. It's so much more efficient and personal  
to hear the messages, which can easily be sent as .wav files."

Zeller's team also appreciates the system's ability to collect phone  
numbers as calls come in. He said, "We have linked our Strata CS 4.0 to our  
individual CS contact databases so when a call comes in, I can tell  
immediately through Caller ID if my caller is calling from his or her home  
phone, cell phone, or office phone. If it is a new contact number, I'm able  
to collect the number instantly by clicking on the number on my PC screen  
and saving it to my database. It's very efficient and doesn't require hours  
of input time."

Zeller's team also uses the extension status feature, which enables  
them to see a display on their PC screen of the status for everyone on the  
Strata CS system. "It's very helpful to be able to tell at a glance who is  
in the office, who's on vacation, who's on the phone, or who is away at a  
meeting. It's like having a full-blown receptionist PC console on every  
single desk," he said.

No More Missed Calls with "Follow-Me" Feature

PhoneAmerica Corp. of Frazer, P.A., began using the original Strata  
CS 3.0 more than a year ago and upgraded to version 4.0 in August as a beta  
user. For this early user, the transition has been dramatic.

Tom Drevyanko, vice president at this telecommunications  
installation and service company, said, "With the Strata CS 4.0, we simply  
don't miss our calls."

Drevyanko's 30-person team uses version 4.0's "follow-me" feature to  
ensure calls reach them quickly. For example, call rules enable users to  
route calls from certain numbers, such as important clients, to their cell  
or home phone numbers, and users can even set up password protection so  
that a call isn't inadvertently answered by someone else, such as a child  
at home.

Drevyanko said, "Our client services personnel appreciate being able  
to take calls no matter where they are by having the calls routed through

the 'follow-me' rules."

Because the service staff is often out in the field, they utilize the system's "call-back" feature to access their messages and return phone calls simply by making one call. They call into the Strata CS from their cell phones and can listen to their messages and return each call, without hanging up, and then go to the next message in queue.

"The 'call-back' feature makes it quick and easy for us to get our calls remotely, return calls, and move onto the next call without wasting time or fumbling for phone numbers. If the caller is in our database, we can have the Strata CS simply dial the number for us," said Drevyanko.

#### Compatibility with Toshiba Digital Telephones Increases Functionality

Drevyanko's team is also using Toshiba digital telephones with the Strata CS 4.0, a powerful new capability now available. "We're happy to have hands-free intercom, up to four primary directory numbers, and secondary appearances for secretaries or partners, as well as all the many other 4.0 features we can access by using Toshiba digital telephones with our Strata CS system," he said.

His team also appreciates the ability to pick up calls from anywhere in the building. Because the system can act as a paging system, calls are routed and get to the right person, even if they're in another department and not near the phones. "Although we love using voice mail, it's nice to know important callers can always get through," Drevyanko said.

Enterprise-Level Call Center Capabilities at a Fraction of the Cost Communications Technologies Inc., of Chesterfield, Mo., is an early user that has maximized the Strata CS 4.0's new call center capabilities by its 15-person team.

Bob Hymes, president of this leading interconnect company, explained: "The Strata CS 4.0 has a phenomenal ACD capability. It's much more powerful than the typical PBX or key system ACD and can be installed at a fraction of the cost. Because the system is scalable, you can dynamically add agents as needed."

Communications Technologies can set up the ACD to handle different types of incoming calls. Hymes explained, "You can have individual announcement messages set up for our various queues -- the customer service queue, the help desk, or your sales line."

To improve customer service, Hymes is using the system's queue time delay announcements so customers know the wait time, and he's also set up skills-based routing to ensure calls get to the right person without delay. He said, "Strata CS 4.0's advanced ACD features really help us manage our calls and improve customer service."

#### Split-Screen GUI Makes Multi-Tasking Fast and Easy

Integrated Office Networks Inc. (ION), a data networks and telecommunication services company in Sanford, Fla., is also an early user of the Strata CS 4.0.

Patrick Talley, president of ION, said, "The Strata CS 4.0 has helped us improve our productivity and customer relations." Talley's 22-person team uses their phones to handle customer inquiries and solve tech support problems. The company's operator uses the 4.0's split-screen GUI to route incoming calls, handle service dispatching, and emergency customer calls while still being able to monitor the status of all system users.

#### About the Strata CS 4.0

The Strata CS 4.0 helps businesses increase customer service and internal productivity by taking advantage of the most advanced voice, data, and call management technologies available today. With a system capacity of 96 trunks and 264 telephones, the Strata CS provides a turnkey business solution that includes the Strata CS application software and dedicated Windows NT(R) server, along with digital telephones, analog feature telephones, and IP telephony. The Strata CS 4.0 also provides the benefits of converged data and voice communications technology.

Strata CS 4.0 features include:

-- Integration with Toshiba's 2000-series digital telephones, bringing improved

functionality, reliability, and quality to the telephone system. The Strata CS

4.0 is one of the few communication server-based telephone systems compatible with digital telephones.

-- Support for standard fixed buttons, programmable buttons, message screening,

and off-hook call announcements via Toshiba digital telephones. Its enhanced

call handling features include multiple directory number appearances, allowing users to receive multiple calls to a single extension. It also enables secondary directory number appearances, which allows a user's extension to appear on and ring on another person's telephone for extended call coverage

-- Expanded ACD capabilities, including the ability to develop custom messages

by queue, control queue configuration via new routing algorithms, remote agent capabilities, and new reporting functionality.

-- Expanded PC-based GUI client interface, making the Strata CS even more intuitive and effective for individual users than previous versions.

-- Choice of using IP along with circuit switched communications on a single

Strata CS 4.0 system. The Strata CS 4.0 is compatible with both IP telephones

and traditional telephones (both analog and digital).

#### Availability

Strata CS Version 4.0 is now available and shipping with all new Strata CS systems. To find an Authorized Toshiba Dealer in your area, visit the Toshiba Web site at [www.telecom.toshiba.com](http://www.telecom.toshiba.com).

#### About Toshiba America Information Systems Inc.

With headquarters in Irvine, and annual sales of approximately \$2.5 billion, Toshiba America Information Systems (TAIS) is comprised of six divisions, organized into two business groups, which manufacture, market, and service a wide range of business and information-oriented products in the United States and Latin America.

Products include portable and desktop computers and PC servers; voice mail systems; digital business telephone systems; interactive voice response systems; network systems; and digital cameras. TAIS is an independent operating company owned by Toshiba America Inc., a subsidiary of the \$50 billion Toshiba Corp., the eighth largest computer and electronics company and the world's 21st largest industrial corporation in terms of sales.

Toshiba Corp. is a world leader in high-technology products with more than 800 major subsidiaries and affiliates worldwide.

#### About Toshiba Telecommunication Systems Division

The Toshiba Telecommunication Systems Division markets the Strata DK family of digital business telephone systems, Strata CS Communication Server, Stratagy voice processing systems, and Interactive Voice Response. For additional product information, contact Toshiba America Information Systems, Telecommunication Systems Division, 9740 Irvine Blvd., P.O. Box 19724, Irvine, Calif. 92618-1697, or visit the Web site at [www.telecom.toshiba.com](http://www.telecom.toshiba.com).

Telecommunications system having delayed cancel call waiting...

...disabled during anticipated return call from host computer accessed for data transmission in dial-up dial - back systems.

...Abstract (Basic): ADVANTAGE - Upon termination of incoming call from host computer, system is restored to its normal operating condition

...Abstract (Equivalent): In a telecommunications system with a call waiting feature, comprising a central office and a plurality of subscribers, said system including means...

...being set to cancel said call waiting feature in response to receipt of a cancellation code over the associated subscriber line and being reset upon termination of the current call, the improvement wherein said central office further comprises a delayed cancel call waiting (DCCW) register...

...register being set to said first state in response to receipt of a DCCW access code transmitted over its associated subscriber line, means for checking and resetting the state of said...

...Abstract (Equivalent): is set to cancel the call waiting feature in response to receipt of a cancellation code over the associated subscriber line and is reset upon termination of a subsequent call. The central office further comprises a delayed cancel call waiting (DCCW) register for each subscriber...

...register is set to the first state in response to receipt of a DCCW access code transmitted over its associated subscriber line...

...ADVANTAGE - Dialler can first enter DCCW access code through telephone keypad...

Inter-office call - back arrangement over common channel...

...Abstract (Basic): The terminating office call processor(34) is  
equipped to examine the busy-idle status of the called station(5...

...station has become idle. Each of the call processor(21, 34) includes an  
originating register- call back register(47) for storing call  
back information comprising the calling and called station identities  
originating office identity, a call back code dialed from a  
calling station(3), a mark to specify the call back mode of  
register operation, a line recheck time delay and a time limit on the  
call back service .

...

...Automatic call back is effected in one arrangement by transferring  
the call back information from the originating to terminating  
office, ascertaining when the called station becomes idle, and then  
making a terminating -to-originating office call in an attempt to  
complete call connections between the calling and called stations.

INCOMING CALL WAIT SYSTEM FOR EXCHANGE

#### ABSTRACT

... avoid waste utility of a communication network due to interrupt of a  
channel till a callback is established by recording a subscriber number  
of a waiting subscriber, calling the waiting subscriber number recorded  
with a prescribed dial code after the end of call and dialing the  
subscriber number automatically...

...CONSTITUTION: When a control processor 5 recognizes a received dial  
code to be a registered dial code of a prescribed wait subscriber  
number recording request upon the receipt of the dial code , the processor  
5 checks a service registration area 61 to confirm unregistration again,  
records registration...

... the end of registration to a caller subscriber 1A in voice. When the  
received dial code indicates a call dial code 0023 calling a recorded

wait subscriber number and requesting the dialing, the control processor 5  
...

ABSTRACT

...a master set to store a number of the caller telephone set and an ID code of a called slave set when the slave set is busy and sending the code to the slave set...

... 3 and the master set 1 stores the telephone number (extension number) and the ID code tentatively. When the talking is terminated, the slave set 2(sub 1) sends a call termination signal to the master set 1, a registration telephone number is displayed on a display...

... the telephone set 5 of the telephone number is implemented automatically. Thus, the slave set calls back the caller telephone set after the end of talking.

Dacom introduces fourtress secure modem  
UK - Dacom introduces fourtress secure modem  
Connexion (Cxn) 21 February 1990 p27

... new secure modem offering two levels of security, each requiring the entry of a valid password. The straightforward password protection option simply requires the entry of a valid password to establish data connection. The dialback option ensures that a data connection can only be made with a remote modem at a pre-determined location since the Fourtress modem terminates the call, looks up the password in its memory and automatically dials the telephone number stored. The modem supports MNP data...

DACOM LAUNCHES FOURTRESS MODEM  
UK - DACOM LAUNCHES FOURTRESS MODEM  
Communications Products Magazine (CPM) 0 February 1990 p35

Dacom has launched the Fourtress modem, offering password protection and dialback security. The two levels of security need a valid password for entry or the call will be terminated by the modem. Under the password protection, data connection will be set up after validation of the password. Under the dialback option the modem will terminate the call, refer to the password in its memory and automatically dial the phone number stored with the password. This means that data can be connected with a remote modem at a predetermined location...?

4. Repeat step 3...technical user to specify barcode symbology or  
automatically insert characters before or after the scanned code and a  
variety of other arcane parameters.

If you are using a PC rather than...site web OPAC publishing for a  
fee. Library Corporation has NetPAC. Auto-Graphics offers the service. A  
number of smaller and potentially less expensive vendors have gotten into  
the market recently...settings when delivered. Consider Spectrum and  
Athena. Spectrum is set by default to require a password to enter every  
functional area. Athena starts out not asking for any passwords at all...

...295/yr thereafter for network version, including update disk and  
toll-free phone support. Guaranteed call back within two hours. Modern  
support through using PCAnywhere remote control software (library pays  
initial cost...will find this powerful feature of interest.

#### Security

Worker Records contains the login name and password of each staff  
member using the system and the list of Permissions associated with that...  
a subject heading (Figure 15).

(Figures 14-15 ILLUSTRATION OMITTED)

The OPAC module has a password -protected administrative mode from  
which its behavior and appearance may be modified. Control of printing...by  
fax at (408) 882-0608 or through e-mail at: custserv@caspr.com. Minor code  
updates are sent whenever required. Major feature updates are sent about  
twice a year. Updates...a record brings up a tabbed patron record editing  
screen. Typical contact information, supplemented by Code, Dept,  
Organization and Patron Type, is entered in the first of three pages of the  
...and LC classification range; Top Patrons, identifying the heaviest  
library users; and Top Patrons by Code, which does the same without  
including patron name. In all cases, the user may send...back into the  
program after security has been enabled, the user is prompted for a  
password. If Allow Guest Access was also specified, the user sees a Guest  
Access check box. Staff users will enter an ID and password and have  
access to the full program, subject only to the security permissions they  
have...a record brings up a tabbed patron record editing screen. Typical  
contact information, supplemented by Code, Dept, Organization and Patron  
Type, is entered in the first of three pages of the...and LC classification  
range; Top Patrons, identifying the heaviest library users; and Top Patrons  
by Code, which does the same without including patron name. In all cases,  
the user may send...

...back into the program after security has been enabled, the user is  
prompted for a password. If Allow Guest Access was also specified, the  
user sees a Guest Access check box. Staff users will enter an ID and  
password and have access to the full program, subject only to the security  
permissions they have...the system. The system administrator may create as  
many or as few logon name and password pairs as desired, each associated  
with one of the nine user groups. Some libraries may wish to give every  
staff member an individual ID and password, with a group assignment  
corresponding to that person's duties within the library. Others may...

...common ID to everyone who performs a particular set of functions,  
essentially one ID and password for each user group. Still other sites  
may find reason to utilize only one or...one to set up a workstation  
capable of only the most limited of circulation functions. Password  
security must be set, of course, to prevent users from gaining access to

other system...Reservation Comment Text and Patron Status Text. Also controlled from here: whether an ID and **password** are required for access, whether web users will be able to place reservations or holds...through the catalog, a wide selection of barcode processing settings, and passwords.

Circ/Cat Plus **password** settings are fewer and less granular than those of many other systems. Passwords may be...

...Inventory, Patron Maintenance, Reports, Site Setup and Utilities. There is no support for a master **password** that can be used in place of individual passwords.

The remainder of the System Setup...wishes to quickly correct a patron's record. An Edit button protected with an optional **password** might make life easier in such circumstances. The workaround is to fire up the Patron...initiating the installation through the Run command on the Windows Start Menu. A separate alphanumeric **password** is necessary for each component, i.e., single-user installers will have a different **password** than multi-user installers. Once begun, the install proceeds in a manner typical of windows...large number of configurable settings. Import, Export and switching to the OPAC via the Change **Password** Level option also begin from the File menu item.

(Figure 1 ILLUSTRATION OMITTED)

Two principles...the response time experienced by a single user during a peak usage period.

Security

A **password** screen greets the user immediately after launching L4U. One selects a user category from a...

...list (Administrator, Librarian, Library Patron, Patron and Upgrade are the choices), enters the case-sensitive **password** noted in the installation documentation, and clicks the OK button. Instead of moving directly into...

...program, however, the user is given a second dialog box and asked to enter a **password** once more. Here's the tricky part. If one enters the **password** --the same one as before--one ends up in the administrative mode. If one instead ignores the **password** request and hits enter or clicks the OK button, one ends up in the OPAC...

...Change **Password** command from the menu bar. Starting from the OPAC and entering an administrative **password** moves one into administrative mode. Starting from administrative mode, bringing up the prompt for a **password** and then hitting enter moves in the other direction. While awkward, this approach works fine once one understands that an L4U **password** alone serves the role of the combination of ID and **password** in most other products.

So how does one manage user groups, passwords and the rights...

...may click on the MARC/Advanced tab, then the Modify Passwords button. From here a **password** may indeed be altered for each of the user categories displayed when one enters the...

...manual warns, in boldface type: "Do not change any fields or settings other than your **password**. If you change other fields, you may damage the L4U program." Strong stuff. Yet, the...

... **Password** allow **password** creation and editing, respectively, at a much more useful level. Figure 3 shows the myriad of permissions that may be set in association with any **password**. The choices are sufficiently granular and the permutations sufficiently numerous to allow for specification of...

...desk.

(Figure 3 ILLUSTRATION OMITTED)

How this relates to the user categories and the initial **password** assigned to the system is not immediately clear. When viewed through Modify ...

... **Password**, the rights and permissions of that **password** are exposed to change every bit as fully as those associated with a newly minted **password**. Nowhere is there an evident connection between this **password** and Group 1, Group 2 and Conversion.

Reports

The Reports menu bar option supports bibliographic...From it renewals, fines and due dates may be managed. Users with a default

circulation password, typically a student, may quickly and easily be given access to some circulation functions, but...functions and capabilities of the module. Every staff user may be given an ID and password that is associated with permission to use specific modules (Figure 2). One may issue separate...

2. Item Loaned: Link (to 'Bar **Code**' in textbase 'CATALOG'), Term Special Filing: file numbers alphabetically Validation: single-only

3. Borrower: Link...

...Figure 9 shows the lending form. One scans in or otherwise enters the item bar **code**. The title and the loan policy associated with it appear as confirmation. Pressing F3 while...

...select Process Return from the Information Professional Menu. The Lending-Return form appears. The bar **code** is scanned and the matching loan transaction is displayed. Pressing F2, clicking the Edit Record...

...current date with a single keystroke. Multiple items can be returned by scanning multiple bar **code** numbers, then selecting Records...or 132 characters wide and, as necessary, a command line and a start-and-stop **code** for controlling that printer.

Codes is an unassuming interface to the control of a myriad...

...modify the choices appearing in drop-down lists for such things as

patron type, priority code, order type, loan code, fine type and many more. The definitions maintained here are used in all other KLAS...

...Circulation Control and Patron Services are not covered, except insofar as a user name and password prevent access to the KLAS desktop and thus preclude launching either of those modules.

Moreover...also provided for optional entry of information about the patron's handicaps, program affiliation, loan code /loan period, and name of another person ultimately responsible for the loan.

Version 6.2 of the Patron module lists Block Maintenance, Reports, Area Code Change and Batch Functions under the Functions pulldown. Unfortunately, all of those options are grayed...

...Blocks, Fees/Fines, Holds and Has-Now. Check-Out requires entry of a patron bar code number. Circulation staff may also look up the borrower by patron ID, bar code or surname. In addition, a surname browse approach is supported. Next, the staff member scans or otherwise enters an item bar code followed by a carriage return. The system confirms the identity of the item and adds...

...not enter a borrower ID at the top of the screen. As each item bar code is entered, the borrower's name appears automatically.

The Functions pulldown menu contains selections for...important functions of setting user rights and permissions, defining users and user groups and specifying code values.

#### CONCLUSIONS

This is clearly, and in conformance with the vendor's own statements, a...otherwise modifying the database; and configuration of the system including assignment of passwords. From the password window the system administrator may temporarily turn off password protection on the circulation functions or on all functions, then later with a single mouse ...in one's choice of sort order, from among author, title, subject, call number, bar code number and date entered into the database.

The final search option, Search Unindexed Field option...of the screen in any of several formats: list, bibliography, display, label, MARC, or bar code .

#### (Figure 12 ILLUSTRATION OMITTED)

Note that, although I did a subject search, it is titles...pane and modify it in the righthand pane. Though far from pretty, the HTML source code for the basic keyword search form (Figure 1), like any other HTML screen one might...View Holdings Code List to select a valid holding code , and the Edit...

...rules are defined that govern the particular patron type with respect to the particular holdings code . Consider that if there are only four patron types and 20 holdings codes there could...must be set up prior to the other two modules. Purchased software carries a key code which the user enters during installation. Without a code , the software is installed in a time-limited demonstration mode.

Unlike most systems, this one...be held for pickup.

Buttons within the Information Editor also lead to Fine Rate Specification, Password Selection and choice of Library versions. One may select manual fine calculation whereby Auto Librarian ignores...

...or Sunday from the automatic calculation of fines. No provision is made for ignoring holidays.

Password security consists of a single password controlling access to all password -protected portions of the program and a series of check boxes that control whether the password is needed to gain access to each of the specified functions: add borrowers, edit borrower...

...work in the Utilities area, work in the Report area, print reports or show the password at startup.

Auto Librarian has multiple personalities hidden within it. One may change a variety...

...on the Setup tab (Figure 2) are the Key Words Build button and the Bar Code Generator button. The indexes used in keyword searching are not built automatically. After records are imported...

...run to adjust the keyword search capability to the changes in the database. The Bar Code Generator produces Code 39 labels (Avery 5160 laser label dimensions: 1" x 2-5/8", 30/page) on...incorrect number. If one

is entering data from the keyboard rather than using a bar code scanner, it is important to hit enter rather than simply tabbing down through the form...

...section of the circulation form behaves in a similar fashion. One may enter a bar code number and hit enter to display a confirming title, or one may use a Search...

...library and the conscientiousness of its staff. Editing can, however, be turned off from the password protection area, precluding access from checkout or elsewhere.

The Due Dates section of the Check...

...has been finished and before another one begins.

The Check In section requires a bar code number followed by a carriage return. If the item exists and is in circulation, the...date as well as rotary cards, mailing labels by name and mailing labels by zip code . A final option allows for generation of a custom letter, its text defined elsewhere in...order to modify it. In such a situation one would likely require use of a password for editing in order to keep the public out of the administrative side of the...

...is presented and made searchable by Title, Author, Callnumber, Subject or Booknum (i.e., bar code number). The Sorted By setting also determines which data elements are presented on the list...screen (Figure 1) one may click on the Begin button to enter the system password and gain access to all system features, or the Minimenu button to bring up a simplified...

...closes the entire program, while TLC returns to the main menu.

Security

A single password controls access to all TLC staff functions. The default password may be changed from the File menu on the system menu bar. Although the Minimenu can...and is more secure to create two icons-one for staff access, which is password-protected , and the other for Minimenu access, which precludes access to any staff functions. This can...

...One also indicates the field and subfield from which to take classification number, bar code number , location and price, and whether the incoming file contains a (distinctly non-MARC) carriage return...

...operations (deletion of malformed records, deletion of duplicates and production of book and bar code labels ).

(Figure 4 ILLUSTRATION OMITTED)

In adding a new record, one has a choice of eight...

...entry fields. Among the labels that can be produced from within Update are bar code and spine labels on a Laserjet printer.

Authority

TLC does not have a formal authority control...Second author name

... programs isn't easy, but you can get some powerful results. WINPRN and its source code can be obtained free of charge by downloading the files from PC MagNet or by...most common errors and what you can do to correct them.

WINPRN contains some special code to work around a bug in HP LaserJet 4 printer drivers that would otherwise prevent...

...difficult for programs that discriminate between variable-pitch and fixed-pitch fonts.

WINPRN'S SOURCE CODE  
WINPRN was written in C and can be compiled with either the Microsoft or the...

...the make file WINPRN. To compile with Borland C++, use WINPRN.BOR. The main source code file, WINPRN.C, is more than 2,000 lines long, so we can't discuss...

...portions of the program that you may care to examine on your own include the code that supports the owner-drawn Print button, the code that determines what fixed-pitch fonts are available when WINPRN is started, the code that supports drag-and-drop files, and the PrintPage function, which outputs one page of...

...topic justice here by providing a brief description of the process, accompanied by some sample code from WINPRN. Additional information is available in the Microsoft Windows SDK, chapter 15 of Programming...

...it's fairly simple. Once the printer port is known, a simple interrupt 17h function call to the system BIOS outputs a character to the printer. A string of characters can be output by...tell Windows that this page is finished and to eject it from the printer.

8. Call EndDoc() to end the print job formally.

9. Delete the printer device context.

And that's only the...

...format--that is, one page, two pages, or four pages per sheet. The full source code for the PrintFile() function is too long to print here, but as mentioned above, it...device context for the default printer. CreatePrinterDC() takes the DEVMODE structure created by BuildDevMode() as input . In code , this sequence looks like this:

```
if ((npDevMode = BuildDevMode (hwnd,  
pl[nLayout].nOrientation)) ==  
NULL) {  
  
    return IDERR...  
}
```

...npDevMode);

If either function fails, an error message is displayed and PrintFile() returns an error code to the caller. If both succeed, PrintFile() calls LocalFree() to free the local memory holding...

...the device context and to determine how many characters will fit on each line. In code, it looks like this:

nSize = GetOutlineTextMetrics

(hdcPrn, ...tested returned 0 to this call (a bug in the printer driver), so I added code to set nsize to 512 if the initial call to GetOutlineTextMetrics returns 0. The normal...

...printing. It is registered with the SetAbortProc() function and prototyped in the following way:

BOOL CALLBACK AbortProc (HDC hdc, int error)

If printing is proceeding smoothly, and there are no errors...

...anticipate more disk space becoming available, your program learns of this from the EndPage() return code. A return code that is greater than or equal to 0 means EndPage() succeeded; a negative value indicates... NOTREPORTED bit in EndPage's return code. PrintFile() ignores other EndPage() error codes, including SP...to GetProcAddress() in step 3 will return NULL.

Enough background; let's look at some code. Specifically, let's see how WINPRN sets the paper orientation prior to printing. The bulk...

...DEVMODE structure is then passed to CreatePrinterDC(), which in turn passes the pointer to Windows' CreateDC() function. The source code for BuildDevMode() is shown in Figure 5.

BuildDevMode() starts off by retrieving information about the...the BuildDevMode() structure to initialize printer settings in addition to the paper orientation. Just add code to modify other fields in the DEVMODE structure and add calling parameters to support them...

...on--are stored in the global pl array, whose format is documented in the source code file WINPRN.C. Think about it!

TEXT:

...described in the August 1992 issue--BADAPP and BADAPP2--showed how  
to implement a notification callback routine that will be called by  
TOOLHELP if your program makes a function call with...

... for the handling of parameter validation errors in BADAPP2.C:  
The program must contain a callback routine, which is entered from  
TOOL-HELP when an exception is detected.

The callback routine must be "exported" in the program's .DEF file.  
The initialization code for the application must allocate a thunk  
for the callback routine with MakeProcInstance(), and register the  
callback with TOOLHELP by calling InterruptRegister().

The termination code for the application must notify TOOLHELP that  
it no longer wants to handle exceptions by calling InterruptUnRegister(),  
and then free the callback thunk by calling FreeProcInstance().

When the application's callback routine is entered, information  
about the cause of the exception is available on the stack...

...general registers at entry is indeterminate, except that AX has been  
loaded by the thunk code with the selector for the application's DGROUP.  
After examining the stack, the callback routine can take one of four  
possible actions:

Indicate that it doesn't want to...

...of the stack, and execute an IRET instruction to restart execution of  
the faulted instruction.

Call TerminateApp () to kill the faulting application.

Retain control by initializing all general and segment registers to...

...exceptions on a per-application basis. As a result, when your  
application registers an interrupt callback routine, that routine will  
receive callbacks for all exceptions that occur in the system--whether...

...This means that your application must maintain internal flags that can be tested by the callback to determine whether the exception should be handled or ignored, and update these flags each...

...Windows, I've modified BADAPP2 to create a new program--BADAPP3--that includes an interrupt callback routine. From a user's point of view, BADAPP3 looks just like BADAPP and BADAPP2...

...kernel. And BADAPP3 cannot be terminated unilaterally by the operating system. Extracts from the source code for BADAPP3 that are relevant to the handling of exceptions are shown in Figure 3, and the assembly language source code for the callback stub is shown in Figure 4. A screen shot of BADAPP3 in action is shown in Figure 5. You can download the complete source code for BADAPP3, along with the precompiled executable program (archived as BADAP3.ZIP) from PC MagNet...

...by which we keep control and restore the CPU to a known state when our callback routine is called because of a divide by zero or general protection fault that occurred in our application. When the callback is entered from TOOLHELP, we can figure out where the fault occurred easily enough, but...that a divide by zero or general protection fault is going to occur in some code that executes in response to a message. Therefore, we call Catch() immediately before decoding a...

...BADAPP3 you may want to ponder and critique is the strategy for letting the exception callback know whether the application is currently in control. BADAPP3 has a global, static-variable, called...

...called  
SendMessage(). Therefore, I decided to maintain the state of ActiveFlag within the window message callback routine instead, setting the flag to TRUE whenever an internal routine is explicitly run in ...

...a message, and setting it to FALSE before calling DefwindowProc or returning from the message callback. This approach could easily be extended by adding a new member to the messages[] structure...

... a whole really fit together, and they built their programs by cutting and pasting source code from other, previously working programs or by cloning source code published by Windows gurus like Charles Petzold and Michael Geary.  
Windows 3.0, which was...

...Watson, and local reboot, I've written a toy program called BADAPP. The C source code for BADAPP is found in Figure 2 (for reasons of space, the header file, module...obtained by writing PC Magazine (see instructions at the end of this column).

The source code for BADAPP is so simple that it should be self-explanatory, and BADAPP is a...

...integer-divide-by-zero operation that Borland C++, for performance reasons, compiles as in-line code without any error checking. The second

routine calls the windows API function Message-Box with...

...our feet wet, however, let's try out ToolHelp's facilities for installing a notification callback routine for Windows API parameter errors. Whenever the application requests a windows function with an invalid parameter, Windows will (while the function call is still in progress) call back into the notification routine with information about the error. This allows the application to decide...

...still gather information about this particular class of bugs.

In order to use a notification callback routine in your own program, you must do the following:

    Register an application-specific window...

...your application's instance initialization routine; this window message will be used by the notification callback routine to communicate with the body of your program.

    Allocate a thunk for the callback routine with MakeProcInstance() in the program's instance initialization routine.

    Register the notification callback routine with TOOLHELP.DLL by calling the function NotifyRegister() in the program's instance initialization routine.

    Implement the notification callback routine itself. This entry must be declared as BOOL FAR PASCAL. It accepts an unsigned single integer and an unsigned double integer as parameters; the single value is an error code and the double value is usually a far pointer to a structure that contains more information about the error. The callback routine is not allowed to do very much except call ToolHelp functions, make a copy...

...one of the application's window handlers to process the message posted by the notification callback and take appropriate action (for example, log the error to a disk file or display an alert dialog).

    Modify the application's termination code to call the ToolHelp function NotifyUnRegister; this allows TOOLHELP.DLL to deallocate those of its internal data...

...static NYLOGERROR or NYLOGPARAMERROR structures to the program; these can be used by the notification callback routine to make local copies of the error information that is passed to it.

    Export the notification callback routine in the application's module definition (.DEF) file.

To illustrate these steps, I have modified the BADAPP.C source code to create a new program, BADAPP2.C, which contains a notification callback. We could not print the entire listing, but extracts of BADAPP2's source code, showing the portions that are specific to the handling of notification callbacks, can be found in Figure 3. As always, you can get the full source code and executable file for BADAPP2.C by downloading it from PC MagNet, or by sending...

WORD COUNT: 2202 LINE COUNT: 00181

...ABSTRACT: two basic modes of access control: pass-through security, under which users must enter a **password**, and **callback**, which hangs up on a user after the **password** is entered and **dials back** at an authorized number. CXR Telcom/Anderson Jacobson's 9653-MM2, NEC America's N9635E...

... modems that offer two basic modes of protection. With pass-through security, users enter a **password** and are allowed access to the computer system attached to the security modem. With **callback**, a user enters a **password**, and the modem hangs up and **dials back** at an authorized number.

The tested modem included CXR Telcom/Anderson Jacobson's 9653-MM2...

...Modem and Ven-Tel Inc.'s 9600 Plus.

All of these modems let administrators store **password** information for at least 30 users.

The best of the crop -- CXR Telcom's 9653...

...MultiModem V32 and Ven-Tel's 9600 Plus offer basic security functions such as **passwords**, **dial - back** and **pass-through**.

With most of these security modems, administrators configure a database in the modem that contains users' **passwords**. The way the modem reacts when it receives a valid **password** from a remote user depends on the security procedures assigned by the administrator to that user. The **dial - back** feature lets the modem **dial back** the user at a specific phone number stored in the security database. This feature is...

...systems.

All of these modems with the exception of FastComm's also offer user-programmed **callback**. With this feature, users who are traveling indicate the number where they want to be called back when they first log on to the modem with their security **password**. Users who cannot be called back (if they are in a hotel with a PBX...

...for example) can use the **pass-through** option. With **pass-through**, once users enter their **password** they are passed through to the computer system attached to the modem.

These modems vary...

...type of characters permitted in **passwords** and whether they include an audit trail. A long **password**, such as 16 characters, permits users to choose a phrase that is difficult for a...

...capture the **passwords**.

Telenetics' OZ Guardian Modem, however, doesn't prompt incoming callers for a **password**. The company rightly figures that such a prompt might just be an invitation for a hacker to start playing. The OZ Guardian Modem simply waits a predetermined time for a **password** string, verifies it and **hangs up** to **call back**. It immediately **hangs up** if the **password** is incorrect. In neither case does an incoming caller get an on-screen indication of...

...s modem.

Administrators enter a string of AT commands and then enter user passwords and **callback** phone numbers. Passwords can be as long as 12 alphanumeric characters. CXR unfortunately does not permit the use of control characters.

Once entered, user names, passwords and **callback** phone numbers are kept in the same directory. Other modems, such as Telenetics', provide one database for the user's name and **password** and another for **callback** telephone numbers.

CXR lets managers decide whether a caller will be prompted on-screen for a **password** -- otherwise, the modem can be set to just wait for the **password**. Managers can also decide whether or not passwords will be upper- or lower-case-sensitive. (The other tested modems are all case-sensitive.)

CXR adds a slight twist to the **callback** process by including an optional feature that asks users to re-enter their **password** once the modem **dials back** the authorized number.

This option would offer more security if the modem could store a second **password** for completing the **callback** process, rather than using the same **password** for all functions. The feature illustrates the compromise vendors sometimes have to make between strong letting users choose between conventional **callback** and caller-programmed **callback**. If a user adds a plus sign and a phone number string at the end of his **password**, the remote modem will **dial back** the supplied number. This can be useful for users who are traveling and not at a predetermined phone number. The MultiModem V32 allows for three **password** attempts within 1 minute before disconnecting.

The device can store as many as 30 user passwords and **callback** phone numbers. Each **password** can include any ASCII characters and be up to 10 characters in length.

Multi-Tech...

...if they were at the computer to which the modem is attached. Although two-level **password** provides some protection, this feature does open up the modem to complete remote configuration.

At 10 characters, the MultiModem V32 ties Ven-Tel's 9600 Plus for the shortest **password** length among these modems. It offers only a limited audit trail.

Multi-Tech's documentation...

...lists step by step the operations needed to set up the database of passwords and **callback** numbers. Unfortunately, this small section on security procedures is bound into the general user manual...

...N9635E is one of the most full-featured of the tested security modems. Along with **callback** or pass-through options, the N9635E lets managers restrict remote user access to specific times...

...OZ Guardian keeps two directories: one for users' names and passwords and another for the **dial - back** telephone number. In the user-name directory, a manager indicates which entry on the **dial - back** directory is intended for a particular user.

OZ Guardian passwords are 12 characters in length...

...include control characters.

In the user-name directory, the manager indicates the length of the **password** that the modem should wait for before starting the verification process. The OZ Guardian has...

...offers basic security functions in its 50-user-capacity 9600 Plus. The modem features standard **callback**, where a preconfigured number is called after the incoming caller's **password** is verified; programmed **callback**, in which the remote user indicates what number should be used for **callback**; and a pass-through, in which remote users are connected to the host computer once...

...10 alphanumeric characters and not permitting control characters to be used as part of a **password**.

Ven-Tel merits praise for turning off remote maintenance of the security database as a...to data lines, calls were made between the two devices. In order to test for **callback** integrity, one phone line was

configured for call-forwarding. -- M.K.

You say you want the indicator lights and flexibility of an external

...

...and send data at the same time? You say you want Hayes compatibility? Well, the **Code -A-Phone Tel-A-Modem** is for you.

**Code -A-Phone**, a long-time maker of telephones, answering machines, and other telephone accessories, has...

...1 without cluttering my desk with its normal complement of two phones and a modem.

**Code -A-Phone** has made a unique product that combines the virtues of an internal modem...

...status LEDs) and throws in a perfectly good desk phone to boot. My suggestion to **Code -A-Phone** is to introduce a 2,400-bps version of the Tel-A-Modem...standard to 19,200 bps, the Fastcomm modems use a 32-bit CRC (cyclic redundancy **code** ) instead of the more usual 16-bit, according to the company.

Unlike the high-speed...1,200-, and 2,400-bps speeds, it recognizes the European CCITT specifications. It has **password** protection, works in transparent synchronous mode with an optional cable (\$99), and it has built

...

...MMP error correction. The stripped-down version has a buffer large enough to hold a **password** and one phone number--useful for synchronous applications in which one number is often dialed to its product, such as the analog and digital self-tests. For example, **password** protection is initiated simply by typing AT N and the **password** in command mode. One great feature is that unlike most other modems, the Acculine 224...

...Hayes AT command set.

Besides offering the full spectrum of commands for dialing, speaker adjust, **code** display, and call originating and receiving, all four models can handle the PBX calling environment...25-pin RS-232 connector at the front end, a battery compartment near the other end, two phone jacks and a transformer plug on the rear, and a bright, screaming-orange plastic body...Professional 2400 offers a number of extras. It can require incoming callers to give a **password** , and it can sense dial and busy tones. Although the modem does not offer a...directory. Other features included in Mite are binary transfer protocols such as Xmodem and a **password** -protection scheme for incoming calls.

**THE LOWER-COST XE SERIES** In addition to its Professional...

...our Hayes compatibility tests, except for one minor instance where it gave an incorrect response **code** after it executed a command. Extra features include the ability to sense dial and busy...corrects errors in data transmission.

The Datalink 2400 offers one other winning feature: it can **store** 20 telephone numbers for **dialing** in its nonvolatile memory.

**SUBSTANTIAL EQUIPMENT** Overall, the Datalink is a more substantial piece of...communicate at 2,400 bps under the v.22 bis standard. In addition, its result **code** compatibility is extended through level 10.

If the name is not important to you--or...

...of the modem and the usually good response you get, you may want to simply **hang up** , **call** again, and hope for a better line.

Another Transcend offering is the PCM2400, which operates...find in good communications software but not in a modem.

The Visionary modem can receive **calls** and **store** them in its 8K (48K optional) buffer until you read the buffer with your PC. It can require a **password** before granting access and even has a **dial - back** feature for greater security. (See "For Your Ears Only: PC Security Modems," PC Magazine, Volume...

...modem will call up and log in for you. You can even program it to **call** MCI Mail (or some other **service** ) and download all your messages. Users of

mail services with day and night rates can...tone used by MCI and other long-distance carriers for you to dial your access code . These options allow you to use the special features of your PBX or speed up...

...to be reset from a tone telephone; the modem can also require a Touch-tone password to be entered before it sends carrier in the auto-answer mode. The RAM buffer...

... solution is to provide security through the communications software on the PC. This usually means password protection. Unfortunately, the designers of operating systems and communications software for the PC often add...

...passwords left by the system designer, which work on all copies of that software) to password files stored as plain DOS text files that can be read by anyone who logs...

...the modems reviewed here provide levels of data protection ranging from simple passwords to full callback . Other modems offer these capabilities as well; look for reviews in an upcoming issue.

PASSWORD SECURITY Both the Cermetek Security Modem, from Cermetek Microelectronics, and Anderson Jacobson's AJ 2412-AD3H store up to 24 passwords and require the caller to enter a password before he is given access to the host PC. They prevent unauthorized people from using...

...is nothing to forget. The answerback process is simple. When the host system answers the call , it sends a code to the caller called WRU for who are you. When the caller's system receives...

...used for many years by the Telex network and is well proven in the field.

CALLBACK PROTECTION Callback protection verifies your location. After you have entered your password into a callback system, the host computer will hang up the phone and call you at the number associated with the password you entered. Both these modems insert a random delay before dialing, to further confuse unauthorized users.

While callback systems are generally considered to provide the ultimate in security, they also create obstructions. Since the host computer calls you back, callback security is not appropriate for users with acoustic couplers, for traveling salesmen, or for other...

...are some significant differences between them. Both of these modems are Hayes compatible and provide password and callback protection if desired. All the security features of each modem can be either selected or disabled.

The AJ also protects your accounts and passwords on the computers you call . The modem can store your log-in scripts for MCI Mail, your corporate mainframe, or other services you may...

...they are available to anyone using the PC. Most communications programs will even display your password every time they log on. Since all access to the memory of the modem requires the supervisor password , even people with access to your PC will not have this sensitive information. Your assistant can even call the services without ever knowing the password .

All the options on the AJ modem can also be reprogrammed via the phone line...

...differences between the two is the way in which stored information such as passwords and callback numbers are reprogrammed. The Cermetek Security

can be programmed only when its key is inserted, while the AJ 2412 requires a master password.

The advantage of both these modems is that they provide a reliable measure of security...

...In Short:A 1,200-bit-per-second external modem with security features including keylock, password, and callback.

AJ 2412-AD3H

Anderson Jacobson Inc., 521 Charcot Ave., San Jose, CA 95131, (408) 435...

...In Short:A 2,400-bit-per-second external modem with extensive security features, including callback and password protection.

SOUNDING OUT THE MODEMS

If the telephone line to your house is quiet enough...carrier tone. Once he has your phone number, the hacker will begin to attack the password protection on your system. Password systems vary greatly as to the degree of protection they provide. The best ones require both an account number and a password before they will report an incorrect entry. This prevents a hacker from knowing when he has guessed a correct account and bad password. The system should also allow only a small number of tries before disconnecting; this prevents...

...the hacker has the names of logged-in users, he just needs to guess the password for one of them.

Users also make the hacker's job easier by using easy...

...and programmer's terms such as FUBAR.

Hackers even have techniques that work with some callback security systems. Some callback devices can be defeated by sending a dial tone down the line, so the callback device will think it is dialing when the caller is really still connected. Callback devices that use a second line to make the return call cannot be fooled by this technique.

The hacker can be defeated by making his life...

...t give in to their usual techniques. The first line of defense is a good password system: avoiding common passwords, changing passwords occasionally, and promptly disabling passwords of people no longer...

... are best reserved for other functions. Unattended remote file transfer very specifically allows users to call into a system with no one at its keyboard and initiate a file transfer. A program with unattended ...that can handle 8 bits will not accept something they see that matches a control code pattern.

Kermit solves this problem by using a 7-bit data length. When the data...beside a Dial Current Number option. Other choices include Enter a New Number to Dial, Hang Up Phone, and Get Parameter File. If you retrieve a parameter file by name, Mastercom dials the...

...choose).

You can save as many parameters files as you wish, storing the telephone number, password, and specific parameters for each service or remote system. This approach permits many more listings...for each on-line service. One nice feature is that the parameter files can be password protected. Although only the function-key definitions are encrypted, this is sufficient to keep valuable...

...on-line, since Morse's string handling is so limited, you can't enforce a **password** . Anyone who happens to dial into the waiting system can do anything he wants, including...

...script file might contain commands to dial a remote system, connect, log on, issue a **password** if necessary, scan for messages, and ask for files to be downloaded. There is no...retries nine times at 5-minute intervals.

Get! has an assortment of usertailorable features, including **password** protection and predefined mailbox scripts. Currently, Get! ships with scripts for ATT Mail, CompuServe, Gem...

...that mail is another story entirely. You must toggle into Get!, tell the modem to **hang up** the phone and hit F9 (auto-log-on), and then Get! calls up the service again and lets you log on by hand. Finally, you can get the mail. Why...

...able to automate your use of Dow Jones News/Retrieval, CompuServe, and other on-line service calls within 10 minutes of installing BackComm; complete novices may require another 10 minutes to run...keeping running logs of time spent on-line with automatic calculation of user-defined rates; **password** protection and file encryption; and file squeezing and unsqueezing.

All this power isn't cheap...set before you dial the number and are reset to defaults once you've finished dialing . Unfortunately, the only way to **store** defaults is by "cloning" the entire program. I can easily envision five or six clones...during the process or interrupt the log-on sequence (say, to type in a secret **password** ) and then resume.

SOPHISTICATED MACROS Omniterm 2 does have a sophisticated macro facility that allows...connecting with other computers. If you wish, however, you can configure this menu item for **calling** a seventh on-line service .

SIMPLE FILE TRANSFER Transferring files while connected to an on-line service is very simple...

...Bureau of Standards) protection method. Anyone receiving a DES-protected file must know the file **password** and have a program capable of decoding the file.

PFS:Access cannot be configured for...

...set up your computer and modem for remote access. You or anyone else with a **password** can call the properly configured computer to upload or download files or to run a...make the operation of the program itself invisible to users.

With Hyper Access's complicated **password** routines, you could, for example, require a caller to enter the proper **password** and then wait for a **callback** from the computer. The caller must be at the authorized phone number that accompanies the **password** in order to establish connection.

UNATTENDED CALLING You could also program Hyper Access to handle...

...The first time you use any of these scripts, you type in your name and **password** in response to screen prompts. The program automatically memorizes this information and furnishes it for you the second time you access that particular service .

DIALING SCRIPTS You can change or add dialing scripts at any time without programming, simply by...

...in a matter of seconds, such data as the number to be called and the **password** .

Hyper Access specifically supports 20 different modems listed by name, but you can use any...power of office telecomputing with plenty of sophisticated features like start-remote access and automatic **call - back** . Telpac offers great communications and screen versatility with bit-rate ranges from 50- to 38...

...thing again.

Telpac's remote-access feature, however, is especially useful. The host PC is **password** protected with three levels of security. The lowest level allows callers to access the host...

...set in the security editor. Access to that editor is in turn controlled by a **password** , so that only ...1200' to a third label, which continues the log-on process.

Although Telios offers no **password** protection for script files, keyboard input at critical times is possible. Instead of incorporating your

...your script files where everyone can read them, you can have the files read the **password** from the keyboard when they execute.

Telios offers some limited DOS access. Normal housekeeping chores... has some "gotchas," though. The first time I used it to set up parameters for **calling** the PC Magazine Interactive Reader Service, I neglected to specify in these parameters that I wanted Xmodem file transfers. When I... ...the Relay Gold menu by pressing Esc. If you actually have to send the escape **code** to an on-line service or bulletin board, that's the F2 key.

The manual...at it.

You can also set up Framework for remote access. You may specify a **password** to limit access to your system when you leave it unattended. When remote users dial in, they must supply this **password** to gain access. Once in, they can control your machine by sending a trigger character...

...you encrypt a worksheet file to prevent others from retrieving it and obtaining a stored **password**, but you can't encrypt ...or the tutorial.

... desirable first level of protection on any computer system is some form of user identification code and passwords, which are administered by the operating system to govern log-on access to...

...so users can easily remember them and avoid writing them down. A five-digit alphanumeric password would have 36 to the fifth power (60,466,176) possible combinations. In security jargon...

...seldom a good practice to permit users to assign their own passwords. A review of password files in systems using this approach often shows that the effective keyspace is trivially small. People tend to use personal names, dates, and other readily guessed information. That type of password system is very easy to break.

The second requirement for effective log-on security is automatic disconnection of the incoming terminal line after a small number of invalid password attempts have been made. The usual limit is three to five attempts. This disconnection, which...

...time required to perform a brute force penetration by a year or more, depending on password characteristics. The programmed attack favored by hackers is then rendered useless. A related and very valuable feature is automatic deactivation of a user identification code if it is used in multiple, invalid log-on attempts.

The third requirement for log...PPDs have on-board microprocessor intelligence, which is used to add a layer of external password protection to any communication line. The PPD will require a potential dial-up terminal user to enter some form of password as a first step toward connecting with the host computer. The PPD then matches this password code with a table of valid user codes stored in its own memory. If the match...

...with the host and permitted to go through the routine log-on sequence. If the code provided by the user is invalid, the user cannot access the host, and the call is terminated.

The important point to remember with these units is that this password checking is completely external and independent of the host computer system. The potential user cannot even contact the host unless the initial password code is correct. Most of these devices are also resistant to the brute force password discovery attack described earlier. Of course, once users pass the obstacle of the PPD, they...

...operating system and application programs.

The PPDs discussed in this article do not protect the password or any data passing between the terminal and host from monitoring by unauthorized parties, i...

...be used on all external communications lines. EXTRA SECURITY FEATURES  
In addition to the special password required, most PPDs have one or more extra security features. Some camouflage the telephone line...

...for switching over to the direct-connect modem after clearance to the host is given.

Callback is a feature available on several PPDS, such as the Tri-Data Oz Guardian and...

...number. A PPD equipped with this capability can keep a person who has stolen its **password** from masquerading as a valid user. To do this, the PPD independently places a return call to the expected terminal location once it verifies the **password code** on the first call. For example, the user would dial the computer telephone number, engage in dialog with the PPD, enter the **password**, and would then be instructed to hang up. The PPD would scan its internal table to check the **code's** validity. For each valid user, the table in memory would contain both a **password** and an associated telephone number. Within a few seconds, the PPD would place a call...

...and proceed to connect the user to the computer's modem or port.

While the **callback** feature does provide an additional layer of communications security, it also causes some problems. One...Lockheed-Getex Data Sentry and the Intergrated Applications Entercept, permit the user to enter the **password** directly via a terminal keyboard. These PPDS operate on the digital side of the modem...

...automatically makes connection to the terminal through the modem. The user must then key the **password** on the terminal keyboard.

Using the terminal rather than the telephone to enter the **password** has a very important advantage for high-security applications, because a much larger selection of characters are available for use in the **password**. The keyspace for devices of this type may include most of all the 128 ASCII...

...numbers, special and graphics symbols, and even nonprinting "control characters." A short five-character ASCII **password** can have a keyspace of over 34 billion combinations. This lies in contrast to a...

...has a maximum of 12 available characters (0 to 9, #, \*). A five-character, touch-tone **password** would have a keyspace of less than one-quarter million, well within brute force cracking...

...International Anasazi's Barrier protects a similar telephone line or port and stores one ASCII **password code**, which all users share. The Digital Pathways Defender II, on the other hand, protects up...

...These single-line devices cost about \$500 each, with a separate autodial modem (required for **callback**) adding another \$600. For multiple-line devices, the cost per line on small configurations is...

...power supply components, with circuit boards added as required for more telephone lines and user **password** tables.

Fig. 2 lists 11 currently known manufacturers of PPDS and their devices, along with...

...identification codes and passwords, failed access attempts, and security event logging?

2. Do I need **callback** authentication? Will the shift in telephone charges be burdensome? Will users put up with the...

...Am I willing to pay the additional salary overhead costs for maintaining tables of user **password** codes and possibly also **callback** telephone numbers for each user?

7. Is it likely that dial-up communication will be...

...computer security administration practices. It is just as easy to be lax in maintaining PPD **password** tables, thereby causing major security risks, as it is to be ineffective

... many as three levels of access authorization--open, private, and secret--are used and typical password systems use randomly generated, six-character codes instead of more easily decipherable English words.

The...

...things coming on the market now are knee-jerk reactions," Campbell says. He specifically dislikes callback-type devices. "Number one, they make it inconvenient for the user, and number two, the main computer site dials back and bears the cost of the phone call."

Callback security devices, such as Defender II, introduced last September by Digital Pathways Inc., Pablo Alto, Calif., are designed to prevent unauthorized dial-in access to computer systems, via a callback procedure. With Defender II, users attempting to access a system are asked for identification. Defender...

...validity of the ID and tells the caller to hang up and wait for a callback. The unit then calls the user at a previously authorized phone number for the ID...

...when this would have been convenient."

This month Getex will begin delivering Data Sentry, a callback intelligent modem. "If you want to call a computer that Data Sentry's guarding," says Davis, "it first asks your phone number. Then it hangs up and checks its list of authorized phone numbers. If yours is authorized, Data Sentry dials back and asks you for the password. If you don't enter the right password in three tries, Data Sentry hangs up and won't let you call back from that number."

A companion Getex product, Remote-ON, lets users with the right password turn their computers on or off from remote terminals. "Calling from a number that's..."

...the authorized list is no problem," says Davis, "since users can set Data Sentry to call back any number that gives it an authorized password."

Davis says he's heard estimates of the cost of computer tampering that go as...

... a sales office number--use that for information. ITT has few regional offices; you can call their customer service department at 800-221-4064.

As you talk to vendors, ask them to send you...

...carrier's switch knows from where the call comes, so you do not have to input your identification code, or the seven-digit local number. Your people only dial a one- or two-digit code to secure their private line from your own switch--and then the area code and number wanted. These lines are installed for a cost in the \$100 range, and...

...served by switching equipment belonging to the carrier, or if the city has foreign exchange service that carries your call to the nearest carrier exchange. The traveler inputs the local number he has been instructed to use, then his regular identification code, and the call

goes to any point reached by the carrier. Some carriers have higher...

...the service is offered, it should be used in preference to the higher-cost Bell System Calling Card, if the carrier can take the call to the designated city.

\* Accounting data. WATS...

...identify a person or a department, and a separate invoice is sent monthly for each code. DISADVANTAGES

In considering whether you should be using the competitive carriers, be sure to recognize...company line terminating at the destination office. If your OCC or resale carrier offers "universal service" this means that your call is reconnected again to a telephone company WATS circuit. Each time the call is reconnected...

...distances. These extra costs may wipe out the saving otherwise provided by the specialized carriers.

\* Code theft. All competing carriers are accessed by a local telephone seven-digit number, followed by a customer-dialed four- to six-digit identification code. Employees who lose their jobs or retire could continue to use your long-distance service unless you change your code frequently.

Suggestions: Handle your OCC or resale calls through your switchboard operator. You dial her; give the distant number. She dials the carrier's number and inputs the code, then turns the line over to you. Or ask your carrier about the automatic device that accepts your dialed call and inserts the needed identification code. Only the "black box" knows the code. Unless code -changing or some other procedure is used your losses on abuse may wipe out your...

...dial the local office of your carrier, but the carrier's computer requires your identification code to be announced by touch-tone impulses. Suggestion: Your carrier may be able to suggest...

...digits to reach the carrier; a seven-digit local number; four- to six-digit identification code; ten-digit area code and distant telephone number; two digits (optional) for one of 99 accounting codes (to identify...

...sells reasonably priced automatic dialers that will input the carrier's local number and identification code. They may also store frequently called distant numbers, compressing the ten digits to an input...

...available dialers.

\* Limited coverage. Depending on the carrier, the circuits may not go where your call must terminate. Try to select a carrier that offers universal service from your city to any telephone...

...selection (ARS) devices at quite reasonable cost. Your users dial a one- or two-digit code that tells your system that you wish to make a long-distance call. You then dial the area code and number. The automatic mechanism selects the preprogrammed channel for the particular area code and number you have dialed. The least expensive call would be placed over a direct...

...next try your WATS line, which provides the least-cost service to the dialed area code. If WATS is busy, the ARS would try the OCC or resale carrier of your...

...less dialing, and you will not have the problem of educating callers on the identification code numbers to use when dialing the OCC or resale carriers. The ARS obviously cuts abuse...instruct your distant offices on careful handling of the special facility. Suggestion: assign an identification code number to those authorized to call on your inward WATS circuit. Your receiving operator says: "May I have your code number, please." She has a list of acceptable codes. This discourages relatives and friends of...

...issue a credit to you if you believe a portion of those calls were unanswered calls.

\* AT&T WATS service versus WATS-like OCC and resale carrier services. Many of the carriers are offering WATS...

...good management techniques, queuing, and patience on the part of your callers. The new switching system offer automatic call - back when a long-distance circuit is busy. Your user inputs a code asking to be called when the circuit is free. Most reasonable people don't mind...

...an SBS foreign exchange line at greater cost. The highest cost is Tier III (universal service), which drops the call off SBS facilities and connects to a WATS line for delivery to any telephone. Tier...

...Do not charge a long-distance call to your hotel room. Instead, use your Bell System calling card by dialing the local telephone company operator. Such a call may be charged as a local call, but you will avoid the long-distance surcharge. If you have an OCC authorization code, and the OCC or resale carrier has an office in the city, make a local call to that office and use your identification code.

2) Do not charge a long-distance call to your office phone. This is called...

...to bill that number. This slows down your call. Instead, you should use your telephone calling card or credit card. Bell System cards now carry a \$1.05 surcharge, plus the direct-dial rate.

3) If you...

...connecting you to their system. There may be a monthly service charge for your identification code, like Execunet's \$10 monthly fee.

There may be a minimum usage charge--Sprint requires...

...install a "System Access Module" (SAM), which permits the user to dial "1," then area code and number. The SAM inputs the other information to carry the call to the U...

...phone bill at home? By all means. All the carriers offer some type of residential service. GTE Sprint only restricts home calling between 9 and 11 AM on weekdays, Mon.-Fri. Other have home service after 5 PM until 8 AM at much lower rates with a \$5 monthly authorization code charge and no minimum usage. Ask the carriers for details. You'll save money over AT...?
